Within Limit

Prediction Limit
Intrawell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Wilk normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 17 background values. Well-constituent pair annual alpha = 0.01179. Individual comparison alpha = 0.005914 (1 of 2).

Within Limits

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limits are highest and lowest of 233 background values. Annual per-constituent alpha = 0.002161. Individual comparison alpha = 0.00009826 (1 of 2). Comparing 3 points to limit. Assumes 8 future values.

Constituent: pH Analysis Run 3/28/2023 8:10 AM View: Appendix III - Two-Step
Plant Bowen Client: Southern Company Data: Bowen 3&4 CCR

Within Limit

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 231 background values. 3.896% NDs. Annual per-constituent alpha = 0.00108. Individual comparison alpha = 0.00004913 (1 of 2). Comparing 2 points to limit. Assumes 9 future values.

Constituent: Sulfate Analysis Run 3/28/2023 8:10 AM View: Appendix III - Two-Step
Plant Bowen Client: Southern Company Data: Bowen 3&4 CCR

Exceeds Limit: GWC-23R

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 227 background values. 4.846% NDs. Annual per-constituent alpha = 0.00108. Individual comparison alpha = 0.00004913 (1 of 2). Comparing 4 points to limit. Assumes 7 future values.

Within Limit

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 231 background values. 64.07% NDs. Annual per-constituent alpha = 0.00108. Individual comparison alpha = 0.00004913 (1 of 2). Comparing 11 points to limit.

Constituent: Boron Analysis Run 3/28/2023 8:23 AM View: Appendix III - Interwell
Plant Bowen Client: Southern Company Data: Bowen 3&4 CCR

Exceeds Limit: GWC-16R, GWC-17R, GWC-21R, GWC-23R

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 231 background values. Annual per-constituent alpha = 0.00108. Individual comparison alpha = 0.00004913 (1 of 2). Comparing 11 points to limit.

Constituent: Calcium Analysis Run 3/28/2023 8:23 AM View: Appendix III - Interwell

PROFESSIONAL GROUNDWATER SCIENTIST CERTIFICATION

I certify that I am a qualified groundwater scientist as demonstrated by Georgia state registered professional geologist certification. I have sufficient training and experience in groundwater hydrology and related fields to make sound professional judgments regarding groundwater monitoring and contaminant fate and transport. I further certify that this Alternate Source Demonstration was completed in accordance with Georgia Environmental Protection Division's Solid Waste Rules (Chapter 391-3-4-.10)

1 Introduction

1.1 Purpose

This document presents an alternate source demonstration (ASD) for the statistically significant increases (SSI) of mercury and chloride detected in compliance well GWC-48 and beryllium detected in compliance well GWC-5 located at Georgia Power Company's (Georgia Power) Plant Bowen Landfill Cells 1 & 2, 3 & 4, and 9 & 10. These SSIs were identified based on statistical evaluation of the groundwater quality data set reported in the 2022 Semi-Annual Groundwater Monitoring & Corrective Action Report, Georgia Power Company Plant Bowen Cells 1 & 2, 3 & 4, and 9 & 10, dated August 31, 2022 (2022 Semi-Annual Report; Stantec, 2022). During the 2022 semi-annual reporting period, one groundwater sampling event was conducted in January-February 2022 and the resampling event was conducted in April 2022.

This ASD has been revised to include additional evidence and sampling results supporting the conclusions that the SSIs identified in GWC-48 and GWC-5 during the 2022 semi-annual reporting period are not related to releases from the landfill.

This ASD has been prepared pursuant to Title 40 Code of Federal Regulations (CFR) 257.94(e)(2) as adopted in Rule 391-3-4.10(6) of the Georgia Environmental Protection Division's Solid Waste Rules (Chapter 391-3-4-.10), which states that "the owner or operator may demonstrate that a source other than the unit caused the contamination or that the statistically significant increase resulted from error in sampling, analysis, statistical evaluation, or natural variation in groundwater quality." This language is consistent with the requirements of the United States Environmental Protection Agency (USEPA) coal combustion residual (CCR) rule (CCR Rule) [Title 40 CFR 257 Subpart D] stipulated in 40 CFR 257.94(e)(2), which has been incorporated by reference into the Georgia Environmental Protection Division (GA EPD) Rules for Solid Waste Management Rule 391-3-4-.10(23)(c) of the Georgia Administrative Code. The Georgia Power Plant Bowen solid waste disposal facility (Site) is operated in accordance with GA EPD Solid Waste Permit No. 008-018D (CCR).

1.2 Site Description and Background

The Site is located in south Bartow County, Georgia, off State Highway 113, approximately seven miles west-southwest of Cartersville and 20 miles southeast of Rome (Figure 1). The Site is approximately 300 acres in size and located on previously undeveloped land contiguous with the plant property. The Site receives coal combustion by-products from coal-burning and flue gas desulfurization processes. The landfill cells were constructed in accordance with Solid Waste Permit No. 008-018D (LI) and approved under CCR permit No. 008-018D (CCR).

Groundwater monitoring is conducted in accordance with the permit requirements specified in the Design and Operation Plan and in accordance with the USEPA CCR Rule, which was adopted by GA EPD in November 2016 and the GA EPD Rules for Solid Waste Management 391-3-4-.10. This includes semi-annual groundwater sampling and continuous groundwater level measurements at the Site. The Site currently remains in detection monitoring.

1.3 CCR Regulatory Framework for Alternate Source Demonstrations

USEPA published the CCR Rule on April 17, 2015. This rule requires groundwater monitoring of active CCR landfills. The CCR Rule establishes multiple phases of groundwater monitoring, including baseline sampling, detection monitoring, and assessment monitoring.

1.3.1 ESTABLISHING GROUNDWATER BASELINE CONDITIONS

To comply with the CCR Rule, a groundwater monitoring system was installed around each regulated CCR unit consisting of a sufficient number of wells installed at appropriate locations and depths to yield groundwater samples from the uppermost aquifer to represent the groundwater quality both upgradient of the unit (i.e., background conditions) and flowing downgradient from the waste boundary of the unit. Based on groundwater flow direction, both upgradient and downgradient wells were installed, and the number of wells varied depending on the size of the CCR unit and the complexity of groundwater flow. Initial groundwater sampling began in 2007 in accordance with the Design and Operation (D&O) Plan, prior to disposal activities, to establish the baseline conditions of groundwater in the vicinity of the CCR unit. The locations of the compliance wells included in the groundwater monitoring system are presented on Figure 2. Following the establishment of baseline conditions, the detection monitoring program commenced.

1.3.2 DETECTION MONITORING PROGRAM

Georgia Power currently monitors groundwater associated with the landfill under the detection groundwater monitoring program in accordance with 40 CFR § 257.94 and Solid Waste Management Rule 391-3-4-.14(22). The semi-annual detection monitoring event occurred in January-February 2022. Groundwater samples were collected from monitoring wells in the groundwater monitoring system (Figure 2) and analyzed for:

- Appendix III constituents according to § 257.94(a) which include boron, calcium, chloride, fluoride, pH, sulfate, and total dissolved solids (TDS).
- A state-modified Appendix I list of detection constituents according to GA EPD Rules for Solid Waste Management 391-3-4-.14 and the approved D&O plan. The state-modified analyte list (D&O Appendix I Metals) includes antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, nickel, selenium, silver, thallium, vanadium, and zinc.

The detection monitoring groundwater results are evaluated using a defined statistical method to determine whether there were SSIs above the natural, or background, concentrations for each constituent in downgradient wells, pursuant to 40 CFR § 257.93(f). Depending on the results acquired from the detection monitoring program, there are several different subsequent actions that must be taken:

- If no SSIs are found, then the CCR facility continues with its detection monitoring program during the active life of the CCR unit and the post-closure period (40 CFR 257.9(b)).

Alternate Source Demonstration for Beryllium, Chloride, and Mercury, January- February 2022
Semi-Annual Event
Plant Bowen Landfill Cells 1 & 2, 3 & 4, and 9 & 10
1 Introduction

- If SSIs are discovered, then the data is further evaluated through an ASD (40 CFR 257.94(e)(2)) to evaluate whether there is an alternate source, an error in the sampling, analysis, statistical evaluation, or natural variability in groundwater quality.
- If an ASD cannot be made, then the facility shifts into an assessment monitoring program within 90 days (40 CFR 257.95(a) and (b)).

2 Alternate Source Demonstration

An ASD is used to further evaluate SSIs identified at wells GWC-48 and GWC-5 based on statistical analyses of the January-February 2022 semi-annual groundwater monitoring data and resampling data in April 2022. Based on review of available Site data, the SSIs reported for mercury and chloride at well GWC-48 and beryllium at well GWC-5 are not associated with a release from the Site and are caused by uncertainty associated with assumptions used for the statistical analysis of the January-February 2022 data (Table 1).

The statistical analysis of the January-February 2022 data was performed in accordance with the USEPA document of *Statistical Analysis of Groundwater Data at RCRA Facilities Unified Guidance* (Unified Guidance) (USEPA, 2009). A review of the statistical analysis was performed by Stantec Consulting Services Inc. (Stantec) and Groundwater Stats Consulting, LLC (GSC). GSC provided revised reports of the April 2022 resampling data based on modified analysis methods described in the subsequent sections to address the SSIs previously reported in the 2022 Semi-Annual Report (Stantec, 2022). The revised GSC reports are included in Appendix A.

Beryllium and Mercury ASD

Beryllium was detected at GWC-5 at an initial concentration of 0.00075 milligrams per liter (mg/L) in January 2022 and mercury was detected at GWC-48 at an initial concentration of 0.00039 mg/L in January 2022. The statistical exceedance of these constituents is likely the result of the statistical analysis methods used, in addition to natural variation of groundwater quality. Information supporting this conclusion includes:

Statistical Analysis Revision (Use of Historical vs Recent Reporting Limits)

As part of the original statistical analysis of the January-February 2022 data, GSC calculated upper prediction limits (UPLs) using historical background data. Prior to calculating UPLs, the historical reporting limits (RLs) for each constituent were replaced with the most recent RLs. The RL for an analyte is always above the method detection limit and reflects concentrations where the laboratory controls precision and bias because the RL is used as a censoring level for quantifying result data. The laboratory RLs decreased for beryllium (0.003 mg/L to 0.0005 mg/L) and mercury (0.0005 mg/L to 0.0002 mg/L) beginning in 2020 (Table 2). RLs are reviewed and updated, when necessary, by the laboratory. The variability in instrumentation, method procedural steps, native background, historical requirements, and general laboratory processes can cause RLs to be different from year to year and lab to lab. In the specific case of beryllium and mercury, the procedures used to determine the RL in 2020 resulted in a value of beryllium (0.0005 mg/L) and mercury (0.0002 mg/L). The RL is comparable to that at other laboratories using a similar criterion.

**Alternate Source Demonstration for Beryllium, Chloride, and Mercury, January- February 2022
Semi-Annual Event
Plant Bowen Landfill Cells 1 & 2, 3 & 4, and 9 & 10
2 Alternate Source Demonstration**

**TABLE 2
REPORTING LIMIT TRENDS FOR BERYLLIUM AND MERCURY
Plant Bowen Landfill Cells 1 & 2, 3 & 4, and 9 & 10
Bartow County, Georgia**

Constituent	September 2020 - February 2022 Reporting Limits	April 2016 - March 2020 Reporting Limits
	mg/L	mg/L
Beryllium	0.000046 - 0.0005	0.003
Mercury	0.000078 - 0.0002	0.0005

The practice of replacing historic RLs with the most recent was employed as a conservative statistical approach intended to capture potential improvements in laboratory techniques or methods which could result in lower RLs. However, this practice may lead to arbitrarily low UPLs in cases where 1) non-parametric methods are used when the constituent is infrequently detected (>50% non-detect reported as less than the RL) and 2) the most recent RL is lower than historical limits.

Due to the frequency of non-detect results for beryllium (92%) at GWC-5 and for mercury (97%) at GWC-48 non-parametric methods were used to estimate the UPL. Consistent with the Unified Guidance (US EPA, 2009), a non-parametric UPL is represented by the highest detected concentration or highest RL in the historical background data set.

The statistical analysis of the January-February 2022 data included in the 2022 Semi-Annual Report, used the most recent and lower RLs as the UPL (beryllium 0.0005 mg/L and mercury 0.0002 mg/L). The use of the lower RLs were not representative of the majority of the RLs in the historical data set collected between 2016-2020 (beryllium at 0.003 mg/L and mercury at 0.0005 mg/L), which resulted in two potential SSIs in the 2022 Semi-Annual Report.

As part of this ASD, the pre-2020 RLs for beryllium and mercury were selected as UPLs, which were previously established and are considered equally protective and representative of the historic data set. When using these previously established UPLs for beryllium and mercury, no exceedances were identified for the 2022 data set; therefore, no further action is necessary. This revision is in the revised GSC report included as Appendix A.

The pre-2020 and post-2020 RLs for both beryllium and mercury are lower than their respective maximum contaminant levels (0.004 mg/L for beryllium and 0.002 mg/L for mercury).

As detection monitoring continues, substituting the most recent RL for historical results will not be done for constituents that are infrequently detected (>50% non-detect concentrations in data set) because they can result in UPLs that are not meaningful or representative of site conditions. In addition, the use of historical data will be evaluated to ensure that it is representative of current site-conditions. Once a sufficient number of sample results (8 – 12 samples) that are analyzed and reported with the lower RLs are collected, the use of historical data will be re-evaluated to ensure that data are representative of current site-conditions.

2 Alternate Source Demonstration**

Naturally Occurring Concentrations and Variation:

Geochemical characterization of groundwater quality data demonstrates little difference between upgradient and GWC-48 and GWC-5 water quality and confirms the absence of a CCR signature in groundwater. A suite of cations and anions were sampled in January-February 2022 from the entire Site groundwater monitoring network and included in the 2022 Semi-Annual Report. Laboratory Analytical Reports are provided in Appendix B. Constituents released from coal ash will shift the relative and absolute abundances of cations and anions away from background conditions. These shifts become apparent when plotted on Piper plots. A CCR impact would characteristically increase the ionic strength and shift ratios away from background, and typically plot at the uppermost portion of the diamond. Upgradient wells and GWC-5 and GWC-48 are depicted on Piper and Stiff plots included as Figures 3 through 6. Upgradient and downgradient groundwater data are generally comingled on the Piper plots, indicating that an outside influence such as a CCR release has not altered groundwater chemistry causing downgradient water quality to be different from upgradient. The wells do not plot in the uppermost portion of the diamond, further indicating that a CCR release has not occurred.

Wells GWC-5, GWC-48, GWA-50, GWA-50R, and GWA-43 have low concentrations and a mixed composition characterized by calcium, magnesium, and bicarbonate type water. The geochemical characterization of GWA-50, GWA-50R, and GWA-43 are generally similar to GWC-48 and GWC-5 water. The relatively low TDS concentrations of these wells (15 to 31 mg/L) suggests that there is minimal variability to the source of groundwater at these locations. Based on a review of Figures 3 and 4, GWC-48 and GWC-5 have a pattern similar to background ionic composition. Therefore, GWC-48 and GWC-5 indicate a natural groundwater composition (chemistry), reflecting background conditions.

Lack of Indicator Parameters Boron and Sulfate:

As stated above, the relatively low TDS concentrations of these wells suggests that there is minimal variability to the source of groundwater at GWC-48 and GWC-5. Typical CCR Appendix III indicator parameters boron and sulfate are historically not detected or detected in very low concentrations in both wells.

- Boron has not been detected above the laboratory RL (0.04 mg/L) in GWC-48 or GWC-5 from sampling data between 2016 to 2022.
- Sulfate has been detected in low concentrations ranging from 0.76 mg/L in March 2018 to 20.2 mg/L in May 2021 at GWC-48. Sulfate was recently detected at GWC-48 at a concentration of 1.2 mg/L from the January 2022 sampling event.

Sulfate has been detected in low concentrations ranging from 1.0 mg/L in February 2022 to 1.87 mg/L in March 2016 at GWC-5. Based on minimal Appendix III indicator parameter detections and geochemical comparison of groundwater quality, data indicate that a release from the Landfill has not occurred, and the beryllium concentrations detected at GWC-5 and mercury concentrations detected at GWC-48 are due to natural variability. When equally protective UPLs using historical RLs were evaluated, no exceedance was identified; therefore, no further action is necessary.

2 Alternate Source Demonstration**

Chloride ASD

Chloride was detected in well GWC-48 at an initial concentration of 4.8 mg/L in January 2022 (Table 1). The statistical exceedance of the chloride UPL in well GWC-48 is likely the result of the statistical analysis methods used, in addition to natural variation of groundwater quality. Information supporting this conclusion includes:

Statistical Analysis Revision (Use of Intrawell Method for Chloride in GWC-48 to Calculate UPL):

- Intrawell methods are more appropriate for chloride in GWC-48 than interwell methods as there is no evidence of historical chloride impacts in well GWC-48. This was demonstrated statistically by comparison of the lower confidence interval of the mean chloride concentration in GWC-48 to the upper tolerance limits for chloride established using pooled background data. GSC provided a revised report (Appendix A) in which intrawell method was used for chloride in GWC-48, resulting in a UPL of 5.485 mg/L. Chloride was detected in well GWC-48 at an initial concentration of 4.8 mg/L in January 2022, which does not exceed the intrawell UPL, 5.485 mg/L. Therefore, the January 2022 detection does not represent a potential SSI.

Statistical Analysis Revision (Use of Non-Parametric vs Parametric Method to Calculate UPL):

- The initial statistical analysis from the 2022 Semi-Annual Report (Stantec, 2022) reported an SSI for chloride in GWC-48 from the January 2022 result of 4.8 mg/L based on an interwell parametric UPL of 4.346 mg/L. Prior to calculating this UPL, goodness of fit testing was used to test for normality of the data set to determine whether parametric or non-parametric methods were appropriate. However, the goodness of fit test was conducted on data collected from both upgradient/background and downgradient wells. In practice goodness of fit testing should only evaluate data collected from upgradient/background wells, because UPLs are representative of upgradient/background conditions.

GSC provided a revised report (Appendix A) in which goodness of fit testing was conducted on only data from upgradient/background wells. This data set did not fit the normal distribution, so parametric methods were not appropriate. Parametric methods are only appropriate when historical upgradient/background data are normally distributed. Therefore, non-parametric methods were used to re-calculate a UPL based on historical upgradient/background sampling, resulting in a UPL of 4.9 mg/L.

Therefore, the January 2022 detection does not represent a potential SSI when compared to the non-parametric interwell UPL or the more appropriate intrawell UPL.

Natural Occurring Concentrations and Variation:

- Recent reported concentrations at downgradient well GWC-48 are similar to those reported historically at upgradient well GWA-43R.
- Chloride concentrations in GWC-48 are within range of regional concentrations in water supply wells (in the range of 1 to 16 mg/L in wells screened in Knox Dolomite and Newala Limestone, USGS Water Supply Paper 1619-FF26, Table 3).

Plant Bowen Landfill Cells 1 & 2, 3 & 4, and 9 & 10

2 Alternate Source Demonstration

- Geochemical characterization of groundwater quality data demonstrates little difference between upgradient, and GWC-48 water quality and confirms the absence of a CCR signature in groundwater. A suite of cations and anions were sampled in January-February 2022 from the entire Site groundwater monitoring network and included in the 2022 Semi-Annual Report. Laboratory Analytical Reports are provided in Appendix B. Constituents released from coal ash will shift the relative and absolute abundances cation and anion away from background conditions. These shifts become apparent when plotted on a Piper or Stiff diagram. The size of each stiff diagram corresponds to overall ionic strength and the shape reflects ratios of cations and anions. A CCR impact would characteristically increase the ionic strength and shift ratios away from background. Upgradient wells and GWC-48 are depicted on Figures 5 and 6, Piper and Stiff Diagrams. Upgradient and downgradient groundwater data are generally comingled on the piper plot (Figure 3), indicating that an outside influence such as a CCR release has not altered groundwater chemistry causing downgradient water quality to be different from upgradient.

GWC-48, GWA-50, GWA-50R, and GWA-43 have low concentrations and a mixed composition characterized by calcium, magnesium, and bicarbonate type. The geochemical characterization of GWA-50, GWA-50R, and GWA-43 are generally similar to GWC-48 water. The relatively low TDS concentrations of these wells (15 to 31 mg/L) suggests that there is minimal variability to the source of groundwater at these locations including GWC-48. Based on a review of Figures 5 and 6, GWC-48 has a pattern similar to background ionic composition. Therefore, GWC-48 indicates a natural groundwater composition (chemistry), reflecting background conditions.

Lack of Indicator Parameters Boron and Sulfate:

As stated above, the relatively low TDS concentrations of these wells suggests that there is minimal variability to the source of groundwater at GWC-48. Typical CCR Appendix III indicator parameters boron and sulfate are historically not detected or detected in very low concentrations in well GWC-48.

- Boron has not been detected above the laboratory RL (0.04 mg/L) in GWC-48 from sampling data between 2016 to 2022.
- Sulfate has been detected in low concentrations ranging from 0.76 mg/L in March 2018 to 20.2 mg/L in May 2021. Sulfate was recently detected at a concentration of 1.2 mg/L from the January 2022 sampling event.

Based on similar background chloride concentrations, minimal Appendix III indicator parameter detections, and geochemical comparison of groundwater quality, data indicate that a release from the Landfill has not occurred and the chloride concentrations detected in GWC-48 is due to natural variability. When an intrawell prediction limit was constructed to evaluate chloride at downgradient well GWC-48, no exceedance was identified; therefore, no further action is necessary.

3 Conclusions

The mercury and chloride concentrations reported for well GWC-48 and beryllium concentration reported for well GWC-5 were identified as potential SSIs during the semi-annual 2022 groundwater detection monitoring event conducted in January-February 2022. A subsequent verification sampling event conducted in April 2022 confirmed the initial concentrations, which resulted in the identification of the SSIs. The lines of evidence summarized in the preceding sections and in the revised GSC statistical report (Appendix A) support the ASD findings that mercury and chloride in GWC-48 and beryllium in GWC-5 are not SSIs. The ASD conclusions are supported by the following information:

- Due to varying detection limits in background data sets over time, a substitution of the most recent, lower reporting limits was used for non-detect concentrations of beryllium and mercury in the historical data used in the January-February 2022 statistical analysis. Use of these lower reporting limits in the statistical analysis resulted in much lower UPLs, resulting in SSIs for beryllium and mercury that are not associated with a release from the Site. When using the original reporting limits as alternate UPLs for beryllium and mercury, no exceedances were identified for the 2022 data set. Consistent with the Unified Guidance, once a sufficient number of sample results (8 – 12 samples) that are analyzed and reported with the lower RLs are collected, the use of historical data will be re-evaluated to ensure that data are representative of current site-conditions.. In addition, based on geochemical comparison of upgradient and downgradient groundwater chemistry and no evidence of a release as represented by Appendix III indicator parameter concentrations, data indicate that a release from the Landfill has not occurred.
- The apparent chloride SSI at well GWC-48 is a result of using interwell prediction limits which were initially recommended in 2015 to evaluate this constituent. Based on similar background chloride concentrations detected in regional groundwater wells, minimal Appendix III indicator parameter detections, and geochemical comparison of groundwater quality, data indicate that a release from the Landfill has not occurred and indicates that chloride detections are due to natural variability. Due to natural variation in groundwater quality unrelated to practices at the Site, intrawell prediction limits are more appropriate for chloride analysis. When an intrawell prediction limit was constructed, a UPL of 5.485 mg/L was calculated for chloride and no exceedance was identified; therefore, no further action is necessary.
- When using non-parametric methods to calculate a UPL for chloride based on historical background sampling, the UPL is reported as 4.9 mg/L, which is above the initial January 2022 chloride detection of 4.8 mg/L in GWC-48. Therefore, the initial exceedance does not represent a potential SSI.

Based on the information presented in this ASD, groundwater monitoring at Plant Bowen Landfill Cells 1 & 2, 3 & 4, 9 & 10 will continue in the detection monitoring phase.

APPENDIX A REVISED GROUNDWATER STATS CONSULTING REPORTS

GROUNDWATER STATS CONSULTING

September 15, 2022

Southern Company Services
Attn: Mr. Joju Abraham
241 Ralph McGill Blvd. NE, Bin 10160
Atlanta, Georgia 30308-3374

Re: Plant Bowen Landfill Cells 1, 2, 9, and 10 – Spring 2022 Resample

Dear Mr. Abraham,

Groundwater Stats Consulting, formerly the statistical consulting division of Sanitas Technologies, is pleased to provide the resample report for the February 2022 sample event for Georgia Power Company's Plant Bowen Landfill Cells 1, 2, 9, and 10. The analysis complies with the United States Environmental Protection Agency (USEPA) Coal Combustion Residuals (CCR) Rule 40 Code of Federal Regulations (CFR) 257 Subpart D, the Georgia Environmental Protection Division (EPD) Rules for Solid Waste Management Chapter 391-3-4-.10 and follows the USEPA Unified Guidance (2009).

Semi-annual sampling is conducted for USEPA's CCR Appendix III parameters, in addition to 16 parameters in accordance with the Georgia EPD's Solid Waste Permit. The monitoring well network, as provided by Southern Company Services, consists of the following:

- **Upgradient wells:** GWA-1, GWA-2, GWA-2R, GWA-3A GWA-4RZ, GWA-39RZ, GWA-39Z, GWA-40, GWA-41, GWA-41R, GWA-42, GWA-43, GWA-43R, GWA-50R, and GWA-50
- **Downgradient wells:** GWC-5, GWC-6, GWC-6RZ, GWC-7Z, GWC-8RR, GWC-8Z, GWC-9, GWC-10, GWC-10R, GWC-11, GWC-11R, GWC-12, GWC-13, GWC-13RZ, GWC-14Z, GWC-15R, GWC-15Z, GWC-44, GWC-45, GWC-45R, GWC-46R, GWC-47, GWC-47R, GWC-48, GWC-49R, and GWC-49Z

Note that well GWA-3 was replaced with GWA-3A, which was first sampled in March 2021. As requested, data from well GWA-3 have been combined with data from replacement well GWA-3A.

Data were sent electronically to Groundwater Stats Consulting, and the resample report statistical analysis was reviewed by Kristina Rayner, Senior Statistician and Founder to Groundwater Stats Consulting.

The following constituents are evaluated on a semi-annual basis:

- **CCR Appendix III:** boron, calcium, chloride, fluoride, pH, sulfate, and TDS
- **Georgia EPD Appendix I:** antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, nickel, selenium, silver, thallium, vanadium, and zinc

Note that the terms “parameters” and “constituents” are interchangeable throughout this report.

Resample Summary – April 2022

Time series and box plots are provided to include resamples collected in April 2022 for well/constituent pairs identified with apparent prediction limits exceedances during the February 2022 sample event (Figures S and T, respectively). Upgradient well data are included in the plots to represent naturally occurring concentration levels in groundwater upgradient of the landfill. Well/constituent pairs with exceedances during February 2022 where previous Alternate Source Demonstrations (ASDs) were prepared are not included in this analysis. The time series plots provide visual representation of concentrations over time while the box plots provide visual representation of variation within individual wells and between all wells. Values in background which have been flagged as outliers may be seen in a lighter font and as a disconnected symbol on the graphs.

Due to varying detection limits in background data sets, a substitution of the most recent reporting limit is typically used for all non-detects. Note that the laboratory reporting limit however, for beryllium decreased from 0.003 mg/L to 0.0005 mg/L and for mercury from 0.0005 mg/L to 0.0002 mg/L in more recent data. Therefore, the historical reporting limits of 0.003 mg/L and 0.0005 mg/L are substituted for all nondetects for beryllium and mercury, respectively. In both cases, the reporting limits are below the established Maximum Contaminant Limits of 0.004 mg/L for beryllium and 0.002 mg/L for mercury.

Resamples were collected in April 2022 and evaluated for the following well/constituent pairs:

Georgia EPD Appendix I

Appendix I Intrawell

- Cadmium: GWC-12

Appendix I Interwell

- Beryllium: GWC-5
- Mercury: GWC-48

CCR Appendix III

Appendix III Interwell

- Chloride: GWC-48

An intrawell prediction limit was constructed to evaluate the resample using background data as discussed previously for cadmium (Figure U). No exceedance was identified for cadmium in well GWC-12; thus, the initial exceedance was not confirmed and no further action is necessary.

Interwell prediction limits were constructed using pooled upgradient well data through February 2022 to evaluate the resamples for beryllium at well GWC-5 and mercury at well GWC-48 (Figure V). When interwell prediction limits were constructed, no exceedances were identified; therefore, no further action is required.

While interwell prediction limits were initially recommended in 2015 to evaluate chloride, more recent evidence provided by Stantec Consultants suggests that intrawell prediction limits are appropriate for this constituent due to natural variation in groundwater quality unrelated to practices at the landfill. Additionally, more recent reported concentrations at downgradient well GWC-48 are similar to those reported historically at upgradient well GWA-43R, and concentrations at all wells are less than 10 mg/L compared to the established Maximum Contaminant Limit of 250 mg/L. When an intrawell prediction limit was constructed to evaluate chloride at downgradient well GWC-48, no exceedance was identified; therefore, no further action is necessary (Figure W).

Thank you for the opportunity to assist you in the statistical analysis of groundwater quality for Plant Bowen Landfill Cells 1, 2, 9 and 10. If you have any questions or comments, please feel free to contact us.

For Groundwater Stats Consulting,

Andrew T. Collins
Project Manager

Kristina L. Rayner
Senior Statistician

GROUNDWATER STATS CONSULTING

October 24, 2022

Southern Company Services
Attn: Mr. Joju Abraham
241 Ralph McGill Blvd. NE, Bin 10160
Atlanta, Georgia 30308-3374

Re: Plant Bowen Landfill Cells 1, 2, 9, and 10
Addendum – February 2022 Sample Event

Dear Mr. Abraham,

Groundwater Stats Consulting, formerly the statistical consulting division of Sanitas Technologies, is pleased to provide the addendum report for the February 2022 sample event for Georgia Power Company's Plant Bowen Landfill Cells 1, 2, 9, and 10. The analysis complies with the United States Environmental Protection Agency (USEPA) Coal Combustion Residuals (CCR) Rule 40 Code of Federal Regulations (CFR) 257 Subpart D, the Georgia Environmental Protection Division (EPD) Rules for Solid Waste Management Chapter 391-3-4-.10 and follows the USEPA Unified Guidance (2009).

Semi-annual sampling is conducted for USEPA's CCR Appendix III parameters, in addition to 16 parameters in accordance with the Georgia EPD's Solid Waste Permit. The monitoring well network, as provided by Southern Company Services, consists of the following:

- **Upgradient wells:** GWA-1, GWA-2, GWA-2R, GWA-3A GWA-4RZ, GWA-39RZ, GWA-39Z, GWA-40, GWA-41, GWA-41R, GWA-42, GWA-43, GWA-43R, GWA-50R, and GWA-50
- **Downgradient wells:** GWC-5, GWC-6, GWC-6RZ, GWC-7Z, GWC-8RR, GWC-8Z, GWC-9, GWC-10, GWC-10R, GWC-11, GWC-11R, GWC-12, GWC-13, GWC-13RZ, GWC-14Z, GWC-15R, GWC-15Z, GWC-44, GWC-45, GWC-45R, GWC-46R, GWC-47, GWC-47R, GWC-48, GWC-49R, and GWC-49Z

Note that well GWA-3 was replaced with GWA-3A, which was first sampled in March 2021. As requested, data from well GWA-3 have been combined with data from replacement well GWA-3A.

Data were sent electronically to Groundwater Stats Consulting, and the statistical analysis was reviewed by and Kristina Rayner, Founder and Senior Statistician to Groundwater Stats Consulting. The analysis was prepared according to the recommended statistical methodology provided in the Fall 2017 by Dr. Kirk Cameron, PhD Statistician with MacStat Consulting and primary author of the USEPA Unified Guidance.

The following constituents are evaluated:

- **CCR Appendix III:** chloride and pH

Note that the terms “parameters” and “constituents” are interchangeable throughout this report.

In earlier analyses, data at all wells for constituents detected in downgradient wells were evaluated for the following: 1) outliers; 2) trends; 3) most appropriate statistical method based on site characteristics of groundwater data upgradient of the facility; and 4) eligibility of downgradient wells when intrawell statistical methods are recommended. Power curves are provided to demonstrate that the selected statistical methods for the parameters listed above comply with the USEPA Unified Guidance and the Georgia Environmental Protection Division Rules for Solid Waste Management Chapter 391-3-4-.10. A few well/constituent pairs have a limited background data set with a minimum of 11 observations due either to sampling or truncation of background date ranges. As more samples are collected, these well/constituent pairs will meet the minimum power requirements. The EPA suggests the selected statistical method should provide at least 55% power at 3 standard deviations or at least 80% power at 4 standard deviations. Power curves were based on the following statistical methods:

CCR Appendix III Constituents:

- Semi-Annual Sampling
- Interwell Prediction Limits with 1-of-2 resample plan – (chloride and pH)
- # Constituents: 7
- # Downgradient wells: 26

Parametric prediction limits are utilized when the screened historical data follow a normal or transformed-normal distribution. When data cannot be normalized or the majority of

data are non-detects, a nonparametric test is utilized. While the false positive rate associated with the parametric limits is based on an annual 10% (5% per semi-annual event) as recommended by the EPA Unified Guidance (2009), the false positive rate associated with the nonparametric limits is dependent upon the available background sample size, number of future comparisons, and verification resample plan. The distribution of data is tested using the Shapiro-Wilk/Shapiro-Francia test for normality. After testing for normality and performing any adjustments as discussed below (US EPA, 2009), data are analyzed using either parametric or non-parametric prediction limits. Non-detects are handled as follows:

- No statistical analyses are required on wells and analytes containing 100% non-detects.
- When data contain <15% non-detects in background, simple substitution of one-half the reporting limit is utilized in the statistical analysis. The reporting limit utilized for non-detects is the most recent practical quantification limit (PQL) as reported by the laboratory.
- When data contain between 15-50% non-detects, the Kaplan-Meier non-detect adjustment is applied to the background data. This technique adjusts the mean and standard deviation of the historical concentrations to account for concentrations below the reporting limit.
- Nonparametric prediction limits are used on data containing greater than 50% non-detects.

Natural systems continuously evolve due to physical changes made to the environment. Examples include capping a landfill, paving areas near a well, or lining a drainage channel to prevent erosion. Periodic updating of background statistical limits is necessary to accommodate these types of changes. In the interwell case, prediction limits are updated with upgradient well data during each event after careful screening for any new outliers. In the intrawell case, data for all wells and constituents may be re-evaluated when a minimum of 4 new data points are available to determine whether earlier concentrations are representative of present-day groundwater quality. In some cases, the earlier portion of data are deselected prior to construction of limits to provide sensitive limits that will rapidly detect changes in groundwater quality. Even though the data are excluded from the calculation, the values will continue to be reported and shown in tables and graphs. impact to groundwater quality downgradient of the facility.

Evaluation of CCR Appendix III Parameters – January/February 2022

Interwell Prediction Limits

For chloride and pH, interwell prediction limits, combined with a 1-of-2 resample plan, were constructed using all historical upgradient well data through January/February 2022. Nonparametric prediction limits were constructed as the background data for chloride and pH did not follow a normal or transformed-normal distributed when tested using the Chi-Squared normality test. Results and a summary table follow this report. The January/February 2022 sample from each downgradient well was compared to the background limit to determine whether exceedances over background are present. Exceedances were identified for the following downgradient well/constituent pairs:

- Chloride: GWC-13RZ
- pH (upper limit): GWC-8RR and GWC-8Z
- pH (lower limit): GWC-9, GWC-44, GWC-45, GWC-48, and GWC-49Z

Summary

Based on the results of the Appendix III constituents requiring interwell prediction limits, the following apparent exceedances were identified:

Appendix III Interwell

- Chloride: GWC-13RZ
- pH (upper limit): GWC-8RR and GWC-8Z
- pH (lower limit): GWC-9, GWC-44, GWC-45, GWC-48, and GWC-49Z

Thank you for the opportunity to assist you in the statistical analysis of groundwater quality for Plant Bowen Landfill Cells 1, 2, 9 and 10. If you have any questions or comments, please feel free to contact us.

For Groundwater Stats Consulting,

Andrew T. Collins
Project Manager

Kristina L. Rayner
Senior Statistician

Exceeds Limit: GWC-13RZ

Prediction Limit
 Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 269 background values. 2.23% NDs. Annual per-constituent alpha = 0.002543. Individual comparison alpha = 0.00004896 (1 of 2). Comparing 26 points to limit.

Constituent: Chloride, Total Analysis Run 10/20/2022 12:05 PM View: Appendix III Interwell
 Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Exceeds Limits: GWC-44, GWC-45, GWC-48, GWC-49Z, GWC-8RR, GWC-8Z, GWC-9

Prediction Limit
 Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limits are highest and lowest of 280 background values. Annual per-constituent alpha = 0.005086. Individual comparison alpha = 0.00009793 (1 of 2). Comparing 26 points to limit.

Constituent: pH Analysis Run 10/20/2022 12:05 PM View: Appendix III Interwell

LABORATORY ANALYTICAL REPORTS

March 10, 2022

Joju Abraham
Georgia Power-CCR
2480 Maner Road
Atlanta, GA 30339

RE: Project: BOWEN LF CELLS 3&4
Pace Project No.: 92585058

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory between January 28, 2022 and February 01, 2022. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Asheville
- Pace Analytical Services - Charlotte
- Pace Analytical Services - Peachtree Corners, GA
- Pace Analytical Services - Minneapolis

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Nicole D'Oleo

QUALIFIERS

Project: BOWEN LF CELLS 3&4
Pace Project No.: 92585058

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

Acid preservation may not be appropriate for 2 Chloroethylvinyl ether.

A separate vial preserved to a pH of 4-5 is recommended in SW846 Chapter 4 for the analysis of Acrolein and Acrylonitrile by EPA Method 8260.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

B Analyte was detected in the associated method blank.

BC The same analyte was detected in an associated blank at a concentration above 1/2 the reporting limit but below the laboratory reporting limit.

M1 Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

REPORT OF LABORATORY ANALYSIS

This report shall not be reproduced, except in full,
without the written consent of Pace Analytical Services, LLC.

Laboratory receiving samples:

Asheville Eden Greenwood Huntersville Raleigh Mechanicsville Atlanta Kernersville

Sample Condition Upon Receipt

Client Name:

GA Power

Project #:

WO#: 92585058

Courier: Commercial Fed Ex UPS USPS Client Pace Other:

Custody Seal Present? Yes No Seals Intact? Yes No

Date/Initials Person Examining Contents: MS 1/29/22

Packing Material: Bubble Wrap Bubble Bags None Other

Biological Tissue Frozen?

Yes No N/A

Thermometer:

IR Gu# ID: 214 Type of Ice: Wet Blue None

Cooler Temp:

5.0 Correction Factor: Add/Subtract (°C) 0.1

Temp should be above freezing to 6°C

Samples out of temp criteria. Samples on ice, cooling process has begun

Cooler Temp Corrected (°C): 5.1

USDA Regulated Soil (N/A, water sample)

Did samples originate in a quarantine zone within the United States: CA, NY, or SC (check maps)?

Yes No

Did samples originate from a foreign source (internationally, including Hawaii and Puerto Rico)? Yes No

Comments/Discrepancy:

Chain of Custody Present?	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A	1.
Samples Arrived within Hold Time?	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A	2.
Short Hold Time Analysis (<72 hr.)?	<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No <input type="checkbox"/> N/A	3.
Rush Turn Around Time Requested?	<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No <input type="checkbox"/> N/A	4.
Sufficient Volume?	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A	5.
Correct Containers Used?	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A	6.
-Pace Containers Used?	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A	
Containers Intact?	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A	7.
Dissolved analysis: Samples Field Filtered?	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A	8.
Sample Labels Match COC?	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A	9.
Includes Date/Time/ID/Analysis Matrix: <u>WT</u>		
Headspace in VOA Vials (>5-6mm)?	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A	10.
Trip Blank Present?	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A	11.
Trip Blank Custody Seals Present?	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A	

COMMENTS/SAMPLE DISCREPANCY

Field Data Required? Yes No

RE: Project: BOWEN LF CELLS 9&10
Pace Project No.: 92585555

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory between February 01, 2022 and February 04, 2022. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Asheville
- Pace Analytical Services - Charlotte
- Pace Analytical Services - Peachtree Corners, GA
- Pace Analytical Services - Minneapolis

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Nicole D'Oleo

QUALIFIERS

Project: BOWEN LF CELLS 9&10

Pace Project No.: 92585555

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

Acid preservation may not be appropriate for 2 Chloroethylvinyl ether.

A separate vial preserved to a pH of 4-5 is recommended in SW846 Chapter 4 for the analysis of Acrolein and Acrylonitrile by EPA Method 8260.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

B Analyte was detected in the associated method blank.

D6 The precision between the sample and sample duplicate exceeded laboratory control limits.

M1 Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

RE: Project: BOWEN LF CELLS 1&2
Pace Project No.: 92586436

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory between February 04, 2022 and February 18, 2022. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Asheville
- Pace Analytical Services - Charlotte
- Pace Analytical Services - Peachtree Corners, GA
- Pace Analytical Services - Minneapolis

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Nicole D'Oleo

QUALIFIERS

Project: BOWEN LF CELLS 1&2

Pace Project No.: 92586436

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

Acid preservation may not be appropriate for 2 Chloroethylvinyl ether.

A separate vial preserved to a pH of 4-5 is recommended in SW846 Chapter 4 for the analysis of Acrolein and Acrylonitrile by EPA Method 8260.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

B Analyte was detected in the associated method blank.

D6 The precision between the sample and sample duplicate exceeded laboratory control limits.

M1 Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

REPORT OF LABORATORY ANALYSIS

This report shall not be reproduced, except in full,
without the written consent of Pace Analytical Services, LLC.

Document Name:
Sample Condition Upon Receipt (SCUR)
 Document No.:
F-CAR-CS-033-Rev.08

Document Revised: November 15, 2021
 Page 1 of 2
 Issuing Authority:
 Pace Carolinas Quality Office

Laboratory receiving samples:

Asheville Eden Greenwood Huntersville Raleigh Mechanicsville Atlanta Kernersville

Sample Condition
 Upon Receipt

Client Name:
GA POWER

Project #: **WO# : 92586436**

Courier: Fed Ex UPS USPS Client
 Commercial Pace Other: _____

92586436

Custody Seal Present? Yes No Seals Intact? Yes No

Date/Initials Person Examining Contents: JPE 2/17/22

Packing Material: Bubble Wrap Bubble Bags None Other
 Thermometer: IR Gun ID: 230 Type of Ice: Wet Blue None

Biological Tissue Frozen?
 Yes No N/A

Cooler Temp: 5.5 Correction Factor: Add/Subtract (°C) +2

Temp should be above freezing to 6°C
 Samples out of temp criteria Samples on ice, cooling process has begun

Cooler Temp Corrected (°C): 5.7

USDA Regulated Soil (N/A, water sample)

Did samples originate in a quarantine zone within the United States: CA, NY, or SC (check maps)?
 Yes No

Did samples originate from a foreign source (internationally, including Hawaii and Puerto Rico)? Yes No

			Comments/Discrepancy:
Chain of Custody Present?	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A		1.
Samples Arrived within Hold Time?	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A		2.
Short Hold Time Analysis (<72 hr.)?	<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No <input type="checkbox"/> N/A		3.
Rush Turn Around Time Requested?	<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No <input type="checkbox"/> N/A		4.
Sufficient Volume?	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A		5.
Correct Containers Used?	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A		6.
-Pace Containers Used?	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A		
Containers Intact?	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A		7.
Dissolved analysis: Samples Field Filtered?	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A		8.
Sample Labels Match COC?	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A		9.
-Includes Date/Time/ID/Analysis Matrix:	<u>WT</u>		
Headspace in VOA Vials (>5-6mm)?	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A		10.
Trip Blank Present?	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A		11.
Trip Blank Custody Seals Present?	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A		

COMMENTS/SAMPLE DISCREPANCY

RE: Project: BOWEN LF CELLS 3&4
Pace Project No.: 92597519

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory on April 06, 2022. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Asheville
- Pace Analytical Services - Charlotte
- Pace Analytical Services - Peachtree Corners, GA
- Pace Analytical Services - Minneapolis

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Nicole D'Oleo

QUALIFIERS

Project: BOWEN LF CELLS 3&4
Pace Project No.: 92597519

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

Acid preservation may not be appropriate for 2 Chloroethylvinyl ether.

A separate vial preserved to a pH of 4-5 is recommended in SW846 Chapter 4 for the analysis of Acrolein and Acrylonitrile by EPA Method 8260.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

H1 Analysis conducted outside the EPA method holding time.

M1 Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

R1 RPD value was outside control limits.

RE: Project: BOWEN LANDFILL
Pace Project No.: 92601912

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory on April 29, 2022. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Asheville
- Pace Analytical Services - Charlotte
- Pace Analytical Services - Peachtree Corners, GA

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Nicole D'Oleo
nicole.d'oleo@pacelabs.com

QUALIFIERS

Project: BOWEN LANDFILL

Pace Project No.: 92601912

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

Acid preservation may not be appropriate for 2 Chloroethylvinyl ether.

A separate vial preserved to a pH of 4-5 is recommended in SW846 Chapter 4 for the analysis of Acrolein and Acrylonitrile by EPA Method 8260.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

M1 Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

PROFESSIONAL GROUNDWATER SCIENTIST CERTIFICATION

I certify that I am a qualified groundwater scientist as demonstrated by Georgia state registered professional geologist certification. I have sufficient training and experience in groundwater hydrology and related fields to make sound professional judgments regarding groundwater monitoring and contaminant fate and transport. I further certify that this Alternate Source Demonstration was completed in accordance with Georgia Environmental Protection Division's Solid Waste Rules (Chapter 391-3-4-.10)

1 Introduction

1.1 Purpose

This document presents an alternate source demonstration (ASD) for the statistically significant increases (SSIs) of sulfate and total dissolved solids (TDS) detected in compliance well GWC-23R located at Georgia Power Company's (Georgia Power) Plant Bowen Landfill Cells 1 & 2, 3 & 4, and 9 & 10. These SSIs were identified based on statistical evaluation of the groundwater quality data set through August 2022 and reported in the 2022 Annual Groundwater Monitoring & Corrective Action Report, Georgia Power Company Plant Bowen Cells 1 & 2, 3 & 4, and 9 & 10, dated January 31, 2023 (2022 Annual Report; Stantec, 2022).

This ASD has been prepared pursuant to Title 40 Code of Federal Regulations (CFR) 257.94(e)(2) as adopted in Rule 391-3-4-.10(6) of the Georgia Environmental Protection Division (GA EPD) Solid Waste Rules (Chapter 391-3-4-.10), which states that "the owner or operator may demonstrate that a source other than the unit caused the contamination or that the statistically significant increase resulted from error in sampling, analysis, statistical evaluation, or natural variation in groundwater quality." This language is consistent with the requirements of the United States Environmental Protection Agency (USEPA) coal combustion residual (CCR) rule [Title 40 CFR 257 Subpart D] (CCR Rule) stipulated in 40 CFR 257.94(e)(2), which has been incorporated by reference into the GA EPD Rules for Solid Waste Management Rule 391-3-4-.10(23)(c) of the Georgia Administrative Code. The Georgia Power Plant Bowen solid waste disposal facility (Site) is operated in accordance with GA EPD Solid Waste Permit No. 008-018D (CCR).

1.2 Site Description and Background

The Site is located in south Bartow County, Georgia, off State Highway 113, approximately seven miles west-southwest of Cartersville and 20 miles southeast of Rome (Figure 1). The Site is approximately 300 acres in size and located on previously undeveloped land contiguous with the plant property. The Site receives coal combustion by-products from coal-burning and flue gas desulfurization processes. The landfill cells were constructed in accordance with Solid Waste Permit No. 008-018D (LI) and approved under CCR permit No. 008-018D (CCR). The landfill is constructed with a minimum of 15 feet of compacted structural fill below base grades and a groundwater separation requirement of 15 feet from bottom of waste per site limitation 9. The liner includes 2 feet of compacted fill with 10^{^-7}K, a 60mil HPDE liner, and a leachate collection system.

Groundwater monitoring is conducted in accordance with the permit requirements specified in the Design and Operation Plan and in accordance with the USEPA CCR Rule, which was adopted by GA EPD in November 2016, and the GA EPD Rules for Solid Waste Management 391-3-4-.10. This includes semi-annual groundwater sampling and continuous groundwater level measurements at the Site. The Site is currently in detection monitoring. The locations of the detection wells included in the groundwater monitoring system are presented on Figure 2.

1.3 Site Geology and Hydrogeologic Setting

The lithologies present in the landfill area of Plant Bowen from the ground surface to depth are terrace deposits, a residuum clay overburden, dolomite, and limestone bedrock, as described in the Hydrogeologic Report and Groundwater Monitoring Plan (Southern Company Services [SCS] 2006). The Knox Group (dolomite and limestone bedrock) produces a characteristic orange to red clayey residuum (overburden) that ranges in thickness from 19 to 127 feet across the Site and often contains weathered chert and dolomite fragments. Silt and clay with some gravel and sand (terrace deposits) overlay the clayey residuum in some areas but are not continuous across the landfill area of Plant Bowen.

Two main hydrostratigraphic layers (water-bearing zones) are present at the Site: overburden (residuum clay), and bedrock (dolomite and limestone) – both units comprise the uppermost aquifer for groundwater monitoring purposes. The uppermost aquifer is unconfined. Overburden materials are heterogeneous ranging in composition from well-graded gravelly sand to fat clay. Bedrock underlying the Site (officially mapped as Knox undifferentiated) is a carbonate bedrock. Karst features within the underlying carbonate bedrock are predominately formed along initial discontinuities including joints, fissures (slots), fractures, and bedding planes or other linear features. These karst features may be partially or completely filled with soft unconsolidated sediments or may be empty or filled with water. The top of the karst features is usually identified as having a thin zone of weathered carbonate bedrock.

2 Alternate Source Demonstration

Stantec Consulting Services Inc. evaluated the SSIs of sulfate and TDS identified at monitoring well GWC-23R based on statistical analyses of the August 2022 semi-annual groundwater monitoring data and resampling data in November 2022. The statistical analysis of the August 2022 data was performed in accordance with the USEPA document *Statistical Analysis of Groundwater Data at RCRA Facilities Unified Guidance* (Unified Guidance) (USEPA, 2009).

Sulfate and Total Dissolved Solids ASD

Upgradient well GWA-56 and downgradient well GWC-23R are screened in dolomite bedrock of the Knox Group based on a review of available boring logs for each well (Appendix B). Sulfate and TDS were detected in well GWC-23R at initial concentrations of 143 milligrams per liter (mg/L) and 586 mg/L, respectively, in August 2022. Reported analytical results for sulfate and TDS concentrations for the resampling event conducted in November 2022 were 137 mg/L and 573 mg/L, respectively (Table 1). Based on review of available Site data, the SSIs reported for sulfate and TDS at well GWC-23R are not associated with a release from the Site and are due to natural variations in background water quality based on the following supporting information explained in detail below:

- Typical CCR Rule Appendix III indicator parameters boron, chloride, fluoride, and pH are historically not detected or detected in very low concentrations in well GWC-23R.
- An evaluation of site groundwater geochemistry demonstrates similarity of water quality between GWC-23R and upgradient wells, specifically GWA-56.
- Decreasing concentrations of water levels contrast with increasing sulfate and TDS concentrations in GWC-23R since 2020. Concentrations for sulfate and TDS decreased over the last 2 sampling events.
- Statistical evaluation of the most current groundwater data set that includes the February 2023 detection monitoring event does not identify an SSI of sulfate at GWC-23R.

Lack of Indicator Appendix III Parameters Boron, Chloride, Fluoride, pH:

Typical CCR Rule Appendix III indicator parameters boron, chloride, fluoride, and pH are historically not detected or detected in very low concentrations in well GWC-23R.

- Most notably, the mobile and sensitive CCR indicator, boron, has not been detected above the laboratory reporting limit (0.04 mg/L) in GWC-23R based on sampling data collected between 2016 to 2022.
- Background range of chloride since 2016 in Cell 3 & 4 upgradient rock wells (GWA-36R, GWA-51RZ, GWA-53R, GWA-55R and GWA-56) is 2.2 mg/L to 8.4 mg/L for Cells 3 and 4. Chloride in GWC-23R has been detected at lower concentrations than the upgradient rock well background concentrations, ranging from 1.3 mg/L to 2.4 mg/L, since 2016.
- Fluoride has not been detected above the laboratory reporting limit (0.1 mg/L) in GWC-23R based on sampling data collected between 2016 to 2022.

**Alternate Source Demonstration for Sulfate and Total Dissolved Solids
August 2022 Semi-Annual Event
Plant Bowen Landfill Cells 1 & 2, 3 & 4, and 9 & 10**

Background range of pH in Cell 3 & 4 upgradient rock wells (GWA-36R, GWA-51RZ, GWA-53R, GWA-55R and GWA-56) is 7.01 to 8.34. pH in GWC-23R has ranged from 7.07 to 7.78 since 2016, which is within upgradient rock well background values. No CCR shifts in pH from background are noted.

Geochemical Characterization

Geochemical characterization of groundwater quality data displays little difference between upgradient wells, especially GWA-56, and downgradient well GWC-23R water quality, demonstrating the sulfate and TDS fluctuations are associated with natural variability in groundwater flow and not associated with a release from the landfill. A suite of cations and anions were sampled in January-February 2022 from the entire Site groundwater monitoring system and included in the 2022 Annual Monitoring and Corrective Action Report. Laboratory analytical reports are provided in Appendix A. Constituents released from CCR shift the relative and absolute abundances of cations and anions away from background conditions. These shifts become apparent as plots on Piper and Stiff diagrams. The plotted location of each cation or anion on a Piper diagram indicates its ionic composition. The size of each Stiff diagram corresponds to overall ionic strength, and the shape of the Stiff diagram reflects ratios of cations and anions. A CCR impact, characteristically, increases the ionic strength and shifts ratios away from background. Cation and anion distributions in groundwater from upgradient wells and GWC-23R are depicted on Piper and Stiff diagrams on Figures 3 and 4a/4b, respectively.

The Piper diagram on Figure 3 shows that there are four different water types displayed by the upgradient and downgradient groundwater data and that the types generally comingle. The first water type contains calcium- and magnesium-dominant cations with bicarbonate as the dominant anion and is indicative of average baseline water quality in upgradient wells GWA-52, GWA-54, GWA-36RA, GWA-51RZ, GWA-53, GWA-53R, GWA-55. The TDS results at these upgradient wells are similar. The second and third water types are found at upgradient locations GWA-37 and GWA-38, respectively. Dominant ions in GWA-37 are sodium and bicarbonate with a slight presence of chloride anion. GWA-38 contains potassium, chloride, and bicarbonate. Both GWA-37 and GWA-38 have very low TDS, which is indicative of water type with little influence from the soil and bedrock. The fourth water type is a dominant mixture of calcium, magnesium, and sodium with bicarbonate at GWA-56 and GWC-23R.

Stiff diagrams in Figures 4a and 4b generally support the water types derived from the Piper plots in Figure 3. Background water quality is generally consistent with typical carbonate dissolution reactions in natural water, where bicarbonate is the dominant ionic product of carbonic acid from meteoric water reacting with calcium/magnesium carbonate aquifer material at a pH in the range of 4-9 standard units (Fetter, pages 356-357). However, the sulfate concentration relative to background in upgradient well GWA-56 at 42.9 mg/L indicates that sulfate-rich water originated from carbonate aquifer materials containing evaporite salts of sodium, calcium, or magnesium upgradient from Cells 3 & 4 (United States Geological Survey Water Supply Paper 1619-FF, page FF24 1963). Downgradient well GWC-23R receives the same sulfate- and sodium-rich water type observed in GWA-56 as shown in groundwater flow direction from Figures 5 and 6.

Response to Water Level Changes

Decreasing concentrations of water levels contrast with increasing sulfate and TDS concentrations in GWC-23R since 2020. Plots of sulfate and TDS detections versus time in GWC-23R use analytical data from sampling events in 2016 to February 2023. Plot of sulfate versus time is shown in Figure 7 and plot

**Alternate Source Demonstration for Sulfate and Total Dissolved Solids
August 2022 Semi-Annual Event
Plant Bowen Landfill Cells 1 & 2, 3 & 4, and 9 & 10**

of TDS versus time is shown in Figure 8. Groundwater elevations for GWC-23R are also shown in Figures 7 and 8.

Gauging events in March 2019 and February 2020 indicate increases in groundwater elevation for GWC-23R. After March 2020, the water level decreased 7.5 feet during the September 2020 gauging event resulting in an increase in sulfate (which affects TDS). Water level increases and stabilizes from December 2020 to July 2021, resulting in decreased sulfate. Groundwater level begins to decline in each well around July 2021. An increasing inverse trend in concentration of sulfate and TDS is noted in GWC-23R from June 2021 to November 2022. Recently, the February 2023 water level increased 3.55 feet resulting in a decline in sulfate and thus TDS. Evaluation of the February 2023 groundwater data set indicates the sulfate detection of 86.7 mg/L at GWC-23R is below the current prediction limit (124 mg/L).

3 Conclusions

The sulfate and TDS concentrations reported for well GWC-23R were verified as SSIs during the semi-annual groundwater detection monitoring event conducted in August 2022. This ASD demonstrates that the SSIs of sulfate and TDS at GWC-23 are attributed to natural variation, and not a release from Landfill Cells 3 & 4. Lines of evidence that supports the ASD conclusion include:

- Typical CCR Rule Appendix III indicator parameters boron, chloride, fluoride, and pH are historically not detected or detected in very low concentrations in well GWC-23R.
- Site groundwater geochemistry demonstrates similarity of water quality between GWC-23R and upgradient wells, specifically GWA-56.
- Decreasing concentrations of water levels contrast with increasing sulfate and TDS concentrations in GWC-23R since 2020. Concentrations for sulfate and TDS decreased over the last 2 sampling events.
- Statistical evaluation of the most current groundwater data set that includes the February 2023 detection monitoring event does not identify an SSI of sulfate at GWC-23R.

Based on the information presented in this ASD, groundwater monitoring at Plant Bowen Landfill Cells 1 & 2, 3 & 4, 9 & 10 will remain in detection monitoring.

APPENDIX A LABORATORY ANALYTICAL REPORTS

August 30, 2022

Joju Abraham
Georgia Power-CCR
2480 Maner Road
Atlanta, GA 30339

RE: Project: BOWEN LF CELLS 3&4
Pace Project No.: 92619171

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory between August 08, 2022 and August 15, 2022. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Asheville
- Pace Analytical Services - Charlotte
- Pace Analytical Services - Peachtree Corners, GA

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Nicole D'Oleo

REPORT OF LABORATORY ANALYSIS

This report shall not be reproduced, except in full,
without the written consent of Pace Analytical Services, LLC.

QUALIFIERS

Project: BOWEN LF CELLS 3&4

Pace Project No.: 92619171

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

Acid preservation may not be appropriate for 2 Chloroethylvinyl ether.

A separate vial preserved to a pH of 4-5 is recommended in SW846 Chapter 4 for the analysis of Acrolein and Acrylonitrile by EPA Method 8260.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

B Analyte was detected in the associated method blank.

D6 The precision between the sample and sample duplicate exceeded laboratory control limits.

M1 Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

R1 RPD value was outside control limits.

DC#_Title: ENV-FRM-HUN1-0083 v01_Sample Condition Upon Receipt

Effective Date: 05/12/2022

Laboratory receiving samples:

Asheville Eden Greenwood Huntersville Raleigh Mechanicsville Atlanta Kernersville

Sample Condition Upon Receipt

Client Name:

GA Power

Project #:

WO#: 92619171

Courier: Commercial Fed Ex Pace UPS USPS Client Other: _____

Custody Seal Present? Yes No Seals Intact? Yes No

Date/Initials Person Examining Contents: 8/8/22 [Signature]

Packing Material: Bubble Wrap Bubble Bags None Other

Biological Tissue Frozen?

Yes No N/A

Thermometer:

IR Gun ID:

214

Type of Ice:

Wet Blue None

Cooler Temp:

1.2

Correction Factor: Add/Subtract (°C)

0.0

Temp should be above freezing to 6°C

Samples out of temp criteria. Samples on ice, cooling process has begun

Cooler Temp Corrected (°C):

1.2

USDA Regulated Soil (N/A, water sample)

Did samples originate in a quarantine zone within the United States: CA, NY, or SC (check maps)? Yes No

Did samples originate from a foreign source (internationally, including Hawaii and Puerto Rico)? Yes No

		Comments/Discrepancy:
Chain of Custody Present?	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A	1.
Samples Arrived within Hold Time?	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A	2.
Short Hold Time Analysis (<72 hr.)?	<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No <input type="checkbox"/> N/A	3.
Rush Turn Around Time Requested?	<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No <input type="checkbox"/> N/A	4.
Sufficient Volume?	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A	5.
Correct Containers Used?	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A	6.
-Pace Containers Used?	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A	
Containers Intact?	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A	7.
Dissolved analysis: Samples Field Filtered?	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A	8.
Sample Labels Match COC?	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A	9.
-Includes Date/Time/ID/Analysis Matrix:	W	
Headspace in VOA Vials (>5-6mm)?	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A	10.
Trip Blank Present?	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A	11.
Trip Blank Custody Seals Present?	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A

RE: Project: Bowen LF Cells 3&4
Pace Project No.: 92634569

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory on November 03, 2022. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Asheville
- Pace Analytical Services - Charlotte
- Pace Analytical Services - Peachtree Corners, GA

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Nicole D'Oleo
nicole.d'oleo@pacelabs.com

QUALIFIERS

Project: Bowen LF Cells 3&4

Pace Project No.: 92634569

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

Acid preservation may not be appropriate for 2 Chloroethylvinyl ether.

A separate vial preserved to a pH of 4-5 is recommended in SW846 Chapter 4 for the analysis of Acrolein and Acrylonitrile by EPA Method 8260.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

D6 The precision between the sample and sample duplicate exceeded laboratory control limits.
