1.0 INTRODUCTION

In accordance with the United States Environmental Protection Agency (US EPA) Coal Combustion Residuals (CCR) rule (40 CFR 257 Subpart D) and the Georgia Environmental Protection Division (EPD) Rules for Solid Waste Management 391-3-4-.10, ACC has prepared this *2020 Semiannual Groundwater Monitoring and Corrective Action Report* to document groundwater monitoring activities conducted at the Georgia Power Company (GPC) Plant McIntosh Existing Landfill No. 4 (Site). Semiannual monitoring and reporting for the CCR unit are performed in accordance with the monitoring requirements of 40 CFR § 257.90 through § 257.95 of the Federal CCR rule, and Georgia EPD Rules for Solid Waste Management 391-3-4-.10(6)(a).

Groundwater monitoring is currently performed in accordance with the Solid Waste Permit No. 051-010D(LI) requirements specified in the Design and Operation (D&O) Plan (GPC, 2010). An EPD-approved 2017 permit minor modification added parameters included in Appendix III and IV of 40 CFR § 257 Subpart D to the groundwater monitoring plan. An application for a new Georgia CCR permit was submitted to EPD in November 2018 for the facility to replace the existing Solid Waste Permit.

This report provides the results of the sampling event conducted in March 2020 and includes: (1) results for a list of constituents derived from Appendix I and II of 40 CFR § 258 included in the D&O Plan in the permit; and (2) CCR detection monitoring sampling event for 40 CFR § 257 Appendix III constituents.

This document serves as the 2020 Semiannual Groundwater Monitoring and Corrective Action Report in accordance with 391-3-4-.10(6)(a).

1.1 SITE DESCRIPTION AND BACKGROUND

Plant McIntosh is located at 981 Old Augusta Central Road, in Effingham County, Georgia, approximately 4 miles northeast of the City of Rincon, and 20 miles north of the City of Savannah. The plant is situated on approximately 2,300 acres (Figure 1, Site Location Map) west of the Savannah River. The Site is located on the western portion of the plant property.

Landfill No. 4 is comprised of Cells 1 and 2A (Figure 2, Well Location Map). Closure construction for Cell 1 of Landfill No. 4 began in June 2015 and final cover construction was completed in August 2016. GPC began construction of Cell 2A in June 2015 and received approval to begin receiving solid waste for disposal on July 20, 2017. Cell 2A of Landfill No. 4 began receiving CCR waste in September 2017. Cells 2B, 3 and 4 are for future development.

1.2 REGIONAL GEOLOGY AND HYDROGEOLOGIC SETTING

Plant McIntosh is located in the Atlantic Coastal Plain Physiographic Province and situated on sediments that were deposited from the Cretaceous to Pleistocene periods. Regional lithology consists of stratified marine deposits and materials eroded from crystalline rock of the Piedmont Physiographic Province. Boring logs describe soils as interbedded clays, silts, and sands typical of Atlantic Coastal Plain sediments.

Monitoring wells and piezometers are screened in the surficial aquifer between approximately 40 and 10 feet North American Vertical Datum of 1988 (NAVD88). The predominant groundwater flow direction is generally to the north but ranges from slightly northeast near Cell 1 to north-northwest near Cell 2B.

1.3 GROUNDWATER MONITORING WELL NETWORK AND CCR UNIT DESCRIPTION

A groundwater monitoring system was installed within the uppermost aquifer at Plant McIntosh Existing Landfill No. 4. The monitoring system is designed to monitor groundwater passing the waste boundary of the CCR Unit within the uppermost aquifer. Figure 2 shows the monitoring well locations. The monitoring system forms a perimeter network around Cells 1, 2A, and 2B (Figure 2). Since Cell 2B has not been developed, monitoring network wells associated with this cell are considered background monitoring locations until future cell construction occurs. Wells were located to serve as upgradient and downgradient monitoring points based on groundwater flow direction (Table 1A, Monitoring Network Well Summary). Existing locations not included in the monitoring network are presented in Table 1B, Piezometer Summary.

2.0 GROUNDWATER MONITORING ACTIVITIES

Pursuant to 40 CFR § 257.90(e), the following describes monitoring-related activities performed during 2020 and discusses any change in status of the monitoring program. All groundwater sampling was performed in accordance with 40 CFR § 257.93. Samples were collected from each well in the certified monitoring system shown on Figure 2 in March 2020. Pursuant to 40 CFR § 257.90(e)(3), a summary and description of groundwater sampling events completed at the Site during the semiannual period is shown on Table 2, Groundwater Sampling Event Summary.

2.1 MONITORING WELL INSTALLATION AND MAINTENANCE

There were no changes to the groundwater monitoring system during the semiannual reporting period; the network remains the same as in the previous reporting year and is shown on Figure 2. Monitoring well-related activities were limited to the following: visual inspection of well conditions prior to sampling, recording the site conditions, and performing exterior maintenance necessary for sampling under safe and clean conditions. Well inspection checklists completed during semiannual sampling are included in Appendix A, Laboratory Analytical and Field Sampling Reports.

The Site monitoring network wells and piezometers were re-surveyed for top of casing elevation and horizontal location in June 2020. A data sheet surveyed by a Georgia Registered Land Surveyor is provided in Appendix B, Monitoring Well Survey Data.

2.2 ALTERNATE SOURCE DEMONSTRATIONS

As discussed in Section 4.0, there is a statistically significant increase (SSI) above background of an Appendix III parameter, chloride in the sample from GWC-9, identified for the current semiannual data set at a level that has not previously been addressed by an alternate source demonstration (ASD). In accordance with Georgia Rule 391-3-4-.10(6)(a) and 40 CFR § 257.94(e)(2), an ASD for the chloride SSI is provided in Appendix C, Alternate Source

Demonstrations. Appendix III SSIs for groundwater monitoring parameters have been previously reported in downgradient wells and addressed by ASDs in accordance with 40 CFR § 257.94(e):

- Boron: GWC-10 (ERM, April 2018)
- Sulfate: GWC-10 and GWC-11 (GEI, February 2019)

An SSI for an Appendix I metal has been addressed in an ASD in accordance with the EPD Rules for Solid Waste Management Chapter 391-3-4.14(23)(c):

- Chromium: GWC-19 (GEI, April 2020)

The recent April and August 2020 ASDs were completed during the current semiannual period and are included in Appendix C.

2.3 DETECTION MONITORING PROGRAM

Detection monitoring is performed on a semiannual basis in accordance with the approved Georgia EPD Solid Waste Permit and the Site's D&O Plan. The first semiannual sampling event was conducted in March 2020.

Groundwater samples from wells in the detection monitoring system were collected from each monitoring well and analyzed for:

- Appendix III constituents according to 40 CFR § 257.94(a); and
- A state-modified Appendix I list of detection parameters according to EPD Rules for Solid Waste Management 391-3-4-14 and the approved D&O plan. The state-modified analyte list includes antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, nickel, selenium, silver, thallium, vanadium, and zinc.

GWC-9 was resampled for chloride in June 2020 to verify analytical results. Copies of the analytical data packages for the semiannual detection monitoring event are included in Appendix A.

2.4 ADDITIONAL SAMPLING

No additional sampling was conducted during the monitoring period.

3.0 SAMPLE METHODOLOGY AND ANALYSIS

The following sections describe the methods used to conduct groundwater monitoring at the Site.

3.1 GROUNDWATER FLOW DIRECTION, GRADIENT, AND VELOCITY

Prior to each sampling event, groundwater elevations were recorded from each well in the network at the Site. Groundwater elevations recorded during the monitoring events are summarized in Table 3, Summary of Groundwater Elevations – March 2020. Groundwater elevation data were used to develop Figure 3, Potentiometric Contour Map – March 2020. As shown on the figure the flow direction is generally to the north but ranges from slightly northeast near Cell 1 to north-northwest near Cell 2B. Groundwater flow patterns observed during the 2020 monitoring event are consistent with historical patterns.

The groundwater flow velocity at the Site was calculated using a derivation of Darcy's Law. Specifically:

Equation

$$v = \frac{K (dh/dl)}{P_e}$$

where: v = groundwater velocity
 K = hydraulic conductivity
 dh/dl = hydraulic gradient
 P_e = effective porosity

Groundwater flow velocities were calculated for the Site based on hydraulic gradients, average hydraulic conductivity based on previous slug test data, and an estimated effective porosity of 0.20. The groundwater flow velocity has been calculated and is tabulated on Table 4, Horizontal Groundwater Flow Velocity Calculations – March 2020. The calculated flow velocity was approximately 0.057 feet per day in the March 2020 event.

3.2 GROUNDWATER SAMPLING

Groundwater samples were collected using low-flow sampling procedures in accordance with 40 CFR § 257.93(a). Purgging and sampling was performed using either a peristaltic pump or non-dedicated QED bladder pump. In all cases pump intakes were located at the midpoint of the well screen (or as appropriate determined by the water level). All non-disposable equipment was decontaminated before use and between well locations using procedures described in the latest version of the Region 4 US EPA SESD Operating Procedure for Field Equipment Cleaning and Decontamination as a guide.

An AquaTroll (In-Situ field instrument) was used to monitor and record field water quality parameters (pH, specific conductance, oxidation-reduction potential, dissolved oxygen [DO], and temperature) during well purging prior to sampling. Turbidity was measured using a LaMotte 2020we portable turbidimeter. Groundwater samples were collected when the following stabilization criteria were met:

- ± 0.1 standard units for pH
- $\pm 5\%$ for specific conductance
- $\pm 10\%$ for DO where $DO > 0.5$ mg/L. No criterion applies if $DO < 0.5$ mg/L.
- Turbidity measurements less than 10 nephelometric turbidity units (NTU)

Once stabilization was achieved, samples were collected directly into appropriately preserved laboratory-supplied sample containers. Sample bottles were placed in ice-packed coolers and submitted to Eurofins Test America, Inc. (Eurofins) of Pittsburgh, Pennsylvania following chain-of-custody protocol. Stabilization logs for each well during each monitoring event are included in Appendix A.

3.3 LABORATORY ANALYSES

Groundwater samples were collected during the groundwater monitoring event in March 2020. Analytical methods used for groundwater monitoring parameters are provided in laboratory reports in Appendix A. Samples were analyzed for Appendix I and Appendix III parameters required by the current state permit during the monitoring event performed in March 2020. Analytical data collected in the monitoring event are summarized in Table 5, Summary of Groundwater Analytical Data – March 2020.

Laboratory analyses were performed by Eurofins. Eurofins is accredited by the National Environmental Laboratory Accreditation Program (NELAP) and maintains a NELAP certification for all parameters analyzed for this project. In addition, Eurofins is certified to perform analysis by the State of Georgia. Laboratory reports and chain-of-custody records for the monitoring events are presented in Appendix A.

3.4 QUALITY ASSURANCE AND QUALITY CONTROL

During each sampling event, quality assurance/quality control (QA/QC) samples are collected at a rate of one set of QA/QC samples per every 10 samples. A set of QA/QC samples includes equipment blanks, field blanks, and duplicate samples. QA/QC sample data were evaluated during data validation and are included in Appendix A.

Groundwater quality data in this report were validated in accordance with US EPA guidance (US EPA, 2011) and the analytical methods. Data validation generally consisted of reviewing sample integrity, holding times, laboratory method blanks, laboratory control samples, matrix spikes/matrix spike duplicate recoveries and relative percent differences (RPDs), post digestion spikes, laboratory and field duplicate RPDs, field and equipment blanks, and reporting limits (RLs). A summary of the data validation is included in Appendix A.

Values followed by a "J" flag in Table 5 indicate that the value is an estimated analyte concentration detected between the method detection limit (MDL) and the laboratory RL. The estimated value is positively identified but is below the lowest level that can be reliably achieved within specified limits of precision and accuracy under routine laboratory operating conditions.

4.0 STATISTICAL ANALYSIS

Statistical analysis of groundwater monitoring data was performed by Groundwater Stats Consulting, LLC (GSC) following the appropriate certified statistical methodology for the Site. Statistical analysis methods and results are provided in Appendix D, Statistical Analysis Report.

4.1 METHODS

The statistical method used at the Site was developed by GSC, using methodology presented in *Statistical Analysis of Groundwater Data at RCRA Facilities, Unified Guidance*, March 2009, US EPA 530/R-09-007 (US EPA, 2009). To develop the statistical methods, analytical data collected during the background period were evaluated and used to develop statistical limits for each Appendix I and Appendix III parameter. Sanitas groundwater statistical software was used to screen the data and perform the statistical analyses. Sanitas is a decision support software

package that incorporates the statistical tests required of Subtitle C and D facilities by US EPA regulations.

Statistically significant increasing trends identified in upgradient wells are not considered SSIs. Typically, when changes in concentrations are present upgradient of the facility, it is an indication of naturally changing groundwater quality.

4.1.1 State Appendix I Parameters

A permit minor modification was approved by EPD on August 20, 2019, following submittal of the 2019 First Semiannual Groundwater Monitoring Report to allow for intrawell methods to be used for evaluation of state Appendix I parameters. Statistical tests used to evaluate the groundwater monitoring data consist of intrawell prediction limits combined with a 1-of-2 verification resample plan for all required Appendix I parameters. Intrawell prediction limits are constructed from historical data within a given well, and the most recent sample is compared to background.

If data from a sampling event initially exceeds the prediction limit, the resampling strategy may be used to verify the result. In 1-of-2 resampling, one independent resample may be collected and evaluated within 90 days to determine whether the initial exceedance is verified. If the resample exceeds the prediction limit, the initial exceedance is verified, and an SSI is identified. When a re-sample result does not verify the initial result, and does not exceed the prediction limit, there is no SSI. If resampling is not performed, the initial exceedance is a confirmed exceedance.

4.1.2 Appendix III Parameters

Statistical tests used to evaluate the groundwater monitoring data consist of interwell prediction limits combined with a 1-of-2 verification resample plan for Appendix III parameters boron, calcium, chloride, fluoride, pH, and total dissolved solids (TDS). Interwell prediction limits pool upgradient well data to establish a background limit for an individual constituent, and the most recent sample from each downgradient well is compared to the same limit for each parameter.

Monitoring results for sulfate were evaluated using intrawell prediction limits combined with a 1-of-2 verification resample plan. A summary of the statistical methodology used at the Site for routine groundwater monitoring is provided in Table 6, Statistical Method Summary.

4.2 SUMMARY OF STATISTICAL ANALYSES RESULTS FOR APPENDIX I PERMIT PARAMETERS

No exceedances of Appendix I parameters were identified during the March 2020 event.

4.3 SUMMARY OF STATISTICAL ANALYSES RESULTS FOR APPENDIX III PARAMETERS

Based on the statistical results presented in Appendix D, the following summarizes parameters exhibiting prediction limit exceedances during the monitoring events:

- Chloride: GWC-9

This exceedance is addressed in the ASD provided in Appendix C. A summary of the ASD is provided in Section 4.4.

4.3.1 Boron at GWC-10

Boron at GWC-10 was reported as an SSI in 2018 and subsequently addressed in an ASD (ERM, 2018). In a letter dated June 24, 2020, EPD requested further demonstration to determine if naturally occurring boron in native soils is present at the facility and support the 2018 ASD for boron. GPC does not recommend further alternate source demonstration of boron at GWC-10 because boron was not identified as a SSI at GWC-10 in the past three consecutive monitoring events (March 2019, September 2019, and April 2020).

Per the statistical method, and in accordance with the Unified Guidance, the inter-well prediction limit for boron is equal to the most recent laboratory specified RL because the upgradient data set contains greater than 50% non-detect results for boron. The laboratory RL was adjusted from 0.050 mg/L to 0.080 mg/L during a laboratory transition and is reflected in data since March 2019. The procedural changes to determine the MDL and RL meets the referenced method quality criteria and is comparable to other laboratories using similar criteria. A letter prepared by Eurofins addressing the change in the RL of boron is included in Appendix A.

Based on a prediction limit of 0.080 mg/L, low-level estimated concentrations between 0.050 mg/L and 0.080 mg/L do not result in SSIs. Since boron was detected less than 0.080 mg/L and not identified as an SSI in 2019 or 2020 data, additional investigation is not necessary.

4.4 ASD SUMMARY

An August 2020 ASD to address an Appendix III SSI not previously addressed by other ASDs is provided in Appendix C. The following lines of evidence presented in the August 2020 ASD and in previous ASDs demonstrate that a release from the CCR Landfill is not the source of the SSIs and explain the likely cause:

- The low-level chloride concentrations in well GWC-9 are stable over time with no discernable increasing trend;
- Other Appendix III CCR indicator parameters do not exhibit SSIs;
- Chloride was documented at higher than current levels at GWC-9 prior to the construction of Cell 2A in 2017. Additionally, the unit is HDPE lined with a leachate collection system designed and operated to eliminate the potential pathway from the unit to groundwater.

5.0 MONITORING PROGRAM STATUS

The Site groundwater monitoring network remains in detection monitoring. Verified SSIs of Appendix I and Appendix III parameters are addressed by ASDs.

6.0 CONCLUSIONS AND FUTURE ACTIONS

This 2020 Semiannual Groundwater Monitoring and Corrective Action Report for GPC's Plant McIntosh Existing Landfill No.4 was prepared to fulfill the requirements of USEPA's CCR Rule and Georgia EPD Rules for Solid Waste Management Chapter 391-3-4-10.

Statistical evaluation of the March 2020 groundwater monitoring data and June 2020 resample data identified an SSI for chloride in GWC-9. An ASD was prepared presenting evidence to conclude that the chloride SSI is not associated with a release from the landfill. The ASD is included in Appendix C. No exceedances of Appendix I parameters were identified during the March 2020 event. The Site will remain in detection monitoring.

The next semiannual detection monitoring event is tentatively scheduled for September 2020.

1. X indicates sampled was collected.
2. Semiannual Detection Event Includes Appendix III and Appendix I.
3. * Well shown within parentheses is proposed name change as described in 2018 permit submittal.
4. ** Wells GWC-17 and GWC-18 are included in background monitoring pool as described in the 2018 ASD.
5. -- = Not sampled

Table 3
Summary of Groundwater Elevations – March 2020

Well ID	Former TOC Elevation (NAVD)	June 18, 2020 Revised TOC Elevation (NAVD)	Groundwater Elevation (NAVD)
GWC-1	47.06	46.85	34.27
GWA-2	53.64	53.43	39.27
GWA-3	57.93	57.75	38.32
GWC-4A(*GWB-4A)	64.98	65.00	41.86
GWC-5(*GWB-5)	62.29	62.09	39.35
GWC-9	53.56	53.38	24.58
GWC-10	49.55	49.39	25.06
GWC-11	57.97	57.74	24.96
GWC-12	57.26	57.05	31.45
GWA-13	60.85	60.93	36.33
GWA-14	61.40	61.59	35.95
GWC-15(*GWB-15)	56.72	56.86	35.26
GWA-16(*GWB-16)	54.60	54.67	31.63
GWC-17	54.19	54.29	28.13
GWC-18	59.68	59.74	24.31
GWC-19	53.62	53.59	24.15
GWC-20	47.23	47.36	24.71
GWC-21	45.16	45.22	24.42
GWC-22(*PZ-22)	51.07	51.17	23.55
GWC-23	52.16	52.43	23.69

Notes:

1. NAVD indicates feet North American Vertical Datum of 1988.
2. Depths to water measured March 9, 2020.
3. September 9, 2019 Groundwater Elevations reference Former TOC Elevations and March 9, 2020 Groundwater Elevations reference Revised TOC Elevations.

Table 4
HORIZONTAL GROUNDWATER FLOW VELOCITY CALCULATIONS
March 2020

Equation

$$v = \frac{K (dh/dl)}{P_e} \quad \text{where: } v = \text{ground water velocity}$$

K = hydraulic conductivity
 dh/dl = hydraulic gradient
 P_e = effective porosity

Values Used in Calculation

Value	Source
K = 3.0E-04 cm/sec 0.86 ft/day	See note 1.
i_1 = 0.013 unitless i_2 = 0.012 unitless i_3 = 0.015 unitless dh/dl = 0.013 unitless	Hydraulic gradient from GWA-3 to GWC-11 GWC-5(*GWB-5) to GWC-23 GWA-14 to GWC-18 Average of i_1 , i_2 , i_3
P_e = 0.20 unitless	See note 2.

Calculated Flow Velocity

$$v = \frac{(0.86)(0.013)}{0.20}$$

$$v = 0.057 \text{ ft/day, or } 21 \text{ ft/year}$$

Notes

(1) Slug tests performed by Southern Company Services, Inc. (2002)

Notes:

1. Results for substances are reported in milligrams per liter (mg/L). pH results are reported in Standard Units.
2. < indicates the substance was not detected above the relevant laboratory method detection limit (MDL).
3. J indicates the substance was detected at such low levels that the precision of the laboratory instruments could not produce a reliable value. Therefore, the value displayed (value J) is qualified by the laboratory as an estimated number.
4. TDS indicates total dissolved solids.
5. Appendix III = indicator parameters evaluated during Detection Monitoring.
6. Parameters required by GWMP are Appendix I parameters included to meet EPD Rule 391-3-4-.14 requirements.
7. -- indicates parameter not analyzed during resample event.

LABORATORY ANALYTICAL AND FIELD SAMPLING REPORTS

Environment Testing TestAmerica

July 16, 2020

Southern Company | Environmental Solutions
241 Ralph McGill Blvd NE, Bin 10160
Atlanta, Georgia 30308
Attn: Kristen Jurinko

Dear Kristen:

The purpose of this letter is to address the change in the reporting limit of Boron from 0.05 mg/L to 0.08 mg/L when Southern Company plants were transitioned to analysis of samples by the Eurofins TestAmerica laboratory in Pittsburgh.

The method detection limit (MDL) is a statistical representation of the 99% confidence level that an analyte concentration is greater than zero. Not long ago the EPA Method Update Rule modified the procedure by which laboratories must determine MDLs. The Eurofins TestAmerica Pittsburgh laboratory along with many other accredited laboratories adopted the new procedure as part of its requirements to obtain state certifications. The process requires a period of data collection and method blank evaluation. The MDL values are calculated from statistical variations of low level standards prepared and analyzed over a series of days and instruments or they are based on historic levels of the analyte in the blank; whichever is greater.

The reporting limit (RL) for an analyte is always above the MDL and reflects concentrations where the laboratory controls precision and bias because the RL is used as a censoring level for quantifying result data. A standard with the analytes at the reporting limit is analyzed as part of the method and must recover within 70-130% of the known value. The procedural changes in the Method Update Rule resulted in changes to MDLs and therefore RLs in some cases. MDL and Reporting Limits (RL) are reviewed annually and updated when necessary. The variability in instrumentation, method procedural steps, native background, historical requirements, and general laboratory processes can cause MDL's and RL's to be different from year to year and lab to lab.

In the specific case of boron the procedures used to determine the MDL and subsequently the RL resulted in the RL value of 0.08 mg/L. Data reported at this value meet the referenced method quality criteria; and, the RL is comparable to that at other laboratories using similar criteria.

Please let me know if you have any additional questions.

Sincerely,

Deborah L. Lowe
Laboratory Director

Comments

050720 Revised Report to add B and Ca to all samples. This report replaces the report previously issued on 050620.

050620 Revised Report to correct all metals to 15 state metals at client request. This report replaces the report previously issued on 042920.

Receipt

The samples were received on 4/1/2020 8:00 AM, 4/2/2020 8:30 AM and 4/3/2020 8:30 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 5 coolers at receipt time were 1.1° C, 1.6° C, 2.1° C, 3.4° C and 4.3° C.

GC Semi VOA

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Metals

Methods 6020B: The continuing calibration verification (CCV) associated with batch 180-313332 recovered above the upper control limit for arsenic and boron. The samples associated with this CCV were non-detects or less than the RL for the affected analytes; therefore, the data have been reported.

Method 6020B: The continuing calibration verification (CCV) associated with batch 180-313470 recovered above the upper control limit for boron. The samples associated with this CCV were non-detects for boron or were below the reporting limit(RL); therefore, the data have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Definitions/Glossary

Client: Southern Company

Job ID: 180-104180-1

Project/Site: CCR - Plant McIntosh Ash Landfill #4

Qualifiers

HPLC/IC

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Metals

Qualifier	Qualifier Description
^	ICV,CCV,ICB,CCB, ISA, ISB, CRI, CRA, DLCK or MRL standard: Instrument related QC is outside acceptance limits.
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
%R	Listed under the "D" column to designate that the result is reported on a dry weight basis
CFL	Percent Recovery
CNF	Contains Free Liquid
DER	Contains No Free Liquid
Dil Fac	Duplicate Error Ratio (normalized absolute difference)
DL	Dilution Factor
DL, RA, RE, IN	Detection Limit (DoD/DOE)
DLC	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
EDL	Decision Level Concentration (Radiochemistry)
LOD	Estimated Detection Limit (Dioxin)
LOQ	Limit of Detection (DoD/DOE)
MDA	Limit of Quantitation (DoD/DOE)
MDC	Minimum Detectable Activity (Radiochemistry)
MDL	Minimum Detectable Concentration (Radiochemistry)
ML	Method Detection Limit
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Not Detected at the reporting limit (or MDL or EDL if shown)
QC	Practical Quantitation Limit
RER	Quality Control
RL	Relative Error Ratio (Radiochemistry)
RPD	Reporting Limit or Requested Limit (Radiochemistry)
TEF	Relative Percent Difference, a measure of the relative difference between two points
TEQ	Relative Toxicity Equivalent Factor (Dioxin)
	Toxicity Equivalent Quotient (Dioxin)

Accreditation/Certification Summary

Client: Southern Company

Project/Site: CCR - Plant McIntosh Ash Landfill #4

Job ID: 180-104180-1

Laboratory: Eurofins TestAmerica, Pittsburgh

All accreditations/certifications held by this laboratory are listed. Not all accreditations/certifications are applicable to this report.

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Question

Answer

Comment

Radioactivity wasn't checked or is </= background as measured by a survey meter.

The cooler's custody seal, if present, is intact.

Sample custody seals, if present, are intact.

The cooler or samples do not appear to have been compromised or tampered with.

Samples were received on ice.

Cooler Temperature is acceptable.

Cooler Temperature is recorded.

COC is present.

COC is filled out in ink and legible.

COC is filled out with all pertinent information.

Is the Field Sampler's name present on COC?

There are no discrepancies between the containers received and the COC.

Samples are received within Holding Time (excluding tests with immediate HTs)

Sample containers have legible labels.

Containers are not broken or leaking.

Sample collection date/times are provided.

Appropriate sample containers are used.

Sample bottles are completely filled.

Sample Preservation Verified.

There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs

Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").

Multiphasic samples are not present.

Samples do not require splitting or compositing.

Residual Chlorine Checked.

LEVEL 2A LABORATORY DATA VALIDATIONS

McIntosh Existing Landfill No. 4

1st Semiannual Event

March-April 2020

Georgia Power Company – McIntosh Landfill 4

Quality Control Review of Analytical Data – March-April 2020

This narrative presents results of the Quality Control (QC) data review performed on analytical data submitted by Eurofins TestAmerica, Pittsburgh for groundwater samples collected at McIntosh LF4 between March 31, 2020 and April 2, 2020. The chemical data were reviewed to identify quality issues which could affect the use of the data for decision-making purposes.

Information regarding the primary sample locations, analytical parameters, QC samples, sampling dates, and laboratory sample delivery group (SDG) designations is summarized in Table 1 of this Appendix. SDG 180-104180 was revised by the laboratory to correct the target metals list.

In accordance with groundwater monitoring and corrective action procedures discussed in Title 40 CFR, Subpart D – Standards for the Disposal of Coal Combustion Residuals in Landfills and Surface Impoundments, the samples were analyzed for detected monitoring constituents listed in 40 CFR, Part 257, Appendix III and assessment monitoring constituents listed in 40 CFR, Part 257, Appendix IV. Test methods included Inductively Coupled Plasma – Mass Spectrometry (USEPA Method 6020B), Determination of Inorganic Anions (USEPA Method 300.0), and Solids in Water (Standard Methods 2540C).

Data were reviewed in accordance with the US EPA Region IV Data Validation Standard Operating Procedures for Contract Laboratory Program Inorganic Data by Inductively Coupled Plasma – Atomic Emission Spectroscopy and Inductively Coupled Plasma – Mass Spectroscopy (September 2011, Rev. 2.0)¹ and the National Functional Guidelines for Inorganic Superfund Methods Data Review (January 2017)². The review included an assessment of the results for completeness, precision (laboratory duplicate recoveries and matrix spike/matrix spike duplicate recoveries), accuracy (laboratory control samples and matrix spike samples), and blank contamination (field, equipment, and laboratory blanks). Sample receipt conditions, holding times, and chains of custody (COCs) were reviewed. Where there was a discrepancy between the QC criteria in the guidelines and the QC criterion established in the analytical methodology, method-specific criteria or professional judgment were used.

DATA QUALITY OBJECTIVES

Laboratory Precision: Laboratory goals for precision were met.

Field Precision: Field goals for precision were met, with the exceptions of Zinc on GWC-23 (180-104220-15) and Boron, Nickel, and Lead on GWC-11 (180-104275-1) as described in the qualifications section below.

Accuracy: Laboratory goals for accuracy were met.

Detection Limits: Project goals for detection limits were met.

Completeness: There were no rejected analytical results for this event, resulting in a completion of 100%.

Holding Times: Holding time requirements were met.

QUALIFICATIONS

In general, chemical results for the samples collected at the site were qualified on the basis of low precision or low accuracy or on the basis of professional judgment. The following definitions provide brief explanations of the qualifiers which may have been assigned to data by the laboratory during the validation process:

J: The analyte was positively identified above the method detection limit; however, the associated numerical value is the approximate concentration of the analyte in the sample

U: The analyte was not detected above the method detection limit

The data generated as part of this sampling event met the QC criteria established in the respective analytical methods and data validation guidelines except as specified below. The applied qualifications may not have been required for all samples collected at the site. A summary of sample qualifications can be found in Table 2 of this Appendix.

- Samples GWC-23 (180-104220-15) and LF4-DUP-01 (180-104220-16) were qualified as estimated (J) for Zinc as the field relative percent difference (RPD) exceeded QC criteria (35.00% above the limit of 25).

- Samples GWC-11 (180-104275-1) and LF4-DUP-02 (180-104275-2) were qualified as estimated (J) for Boron, Nickel, and Lead as the field RPDs exceeded QC criteria (49.06%, 44.90%, and 32.56%, respectively above limit of 25).
- Certain Copper, Lead, and/or Zinc results in SDG 180-104180 were qualified as non-detect (U) due to the analyte(s) being detected at a similar concentration in an associated blank sample. As shown in Table 2, when the original sample result was below the RL, the method detection limit (MDL) was raised to the sample result as part of the qualification process. As shown in Table 2, when the original sample result was above the reporting limit (RL), both the RL and MDL were raised to the sample result as part of the qualification process.

Atlantic Coast Consulting, Inc. reviewed the laboratory data from McIntosh LF4 sampled between March 31, 2020 and April 2, 2020 in accordance with the analytical methods, the laboratory-specified QC criteria, and the guidelines. As described above, the results were acceptable for project use.

- | | | | | |
|---|--|-------------------------------------|-------------------------------------|-------|
| a | Is the well visible and accessible? | <input checked="" type="checkbox"/> | _____ | _____ |
| b | Is the well properly identified with the correct well ID? | <input checked="" type="checkbox"/> | _____ | _____ |
| c | Is the well in a high traffic area and does the well require protection from traffic? | _____ | <input checked="" type="checkbox"/> | _____ |
| d | Is the drainage around the well acceptable? (no standing water, nor is well located in obvious drainage flow path) | _____ | <input checked="" type="checkbox"/> | _____ |

2 Protective Casing

- | | | | | |
|---|---|-------------------------------------|-------|-------|
| a | Is the protective casing free from apparent damage and able to be secured? | <input checked="" type="checkbox"/> | _____ | _____ |
| b | Is the casing free of degradation or deterioration? | <input checked="" type="checkbox"/> | _____ | _____ |
| c | Does the casing have a functioning weep hole? | <input checked="" type="checkbox"/> | _____ | _____ |
| d | Is the annular space between casings clear of debris and water, or filled with pea gravel/sand? | <input checked="" type="checkbox"/> | _____ | _____ |
| e | Is the well locked and is the lock in good condition? | <input checked="" type="checkbox"/> | _____ | _____ |

3 Surface pad

- | | | | | |
|---|--|-------------------------------------|-------|-------|
| a | Is the well pad in good condition (not cracked or broken)? | <input checked="" type="checkbox"/> | _____ | _____ |
| b | Is the well pad sloped away from the protective casing? | <input checked="" type="checkbox"/> | _____ | _____ |
| c | Is the well pad in complete contact with the protective casing? | <input checked="" type="checkbox"/> | _____ | _____ |
| d | Is the well pad in complete contact with the ground surface and stable? (not undermined by erosion, animal burrows, and does not move when stepped on) | <input checked="" type="checkbox"/> | _____ | _____ |
| e | Is the pad surface clean (not covered with sediment or debris)? | <input checked="" type="checkbox"/> | _____ | _____ |

4 Internal casing

- | | | | | |
|---|---|-------------------------------------|-------|-------|
| a | Does the cap prevent entry of foreign material into the well? | <input checked="" type="checkbox"/> | _____ | _____ |
| b | Is the casing free of kinks or bends, or any obstructions from foreign objects (such as bailers)? | <input checked="" type="checkbox"/> | _____ | _____ |
| c | Is the well properly vented for equilibration of air pressure? | <input checked="" type="checkbox"/> | _____ | _____ |
| d | Is the survey point clearly marked on the inner casing? | <input checked="" type="checkbox"/> | _____ | _____ |
| e | Is the depth of the well consistent with the original well log? | <input checked="" type="checkbox"/> | _____ | _____ |
| f | Is the casing stable? (or does the pvc move easily when touched or can it be taken apart by hand due to lack of grout or use of slip couplings in construction) | <input checked="" type="checkbox"/> | _____ | _____ |

5 Sampling: Groundwater Wells Only:

- | | | | | |
|---|---|-------------------------------------|-------------------------------------|-------|
| a | Does well recharge adequately when purged? | <input checked="" type="checkbox"/> | _____ | _____ |
| b | If dedicated sampling equipment installed, is it in good condition and specified in the approved groundwater plan for the facility? | _____ | <input checked="" type="checkbox"/> | X |
| c | Does the well require redevelopment (low flow, turbid)? | _____ | <input checked="" type="checkbox"/> | _____ |

6 Based on your professional judgement, is the well construction / location appropriate to 1) achieve the objectives of the Groundwater Monitoring Program and 2) comply with the applicable regulatory requirements?

| a | Is the protective casing free from apparent damage and able to be secured? | <input checked="" type="checkbox"/> | _____ | _____ |
| b | Is the casing free of degradation or deterioration? | <input checked="" type="checkbox"/> | _____ | _____ |
| c | Does the casing have a functioning weep hole? | <input checked="" type="checkbox"/> | _____ | _____ |
| d | Is the annular space between casings clear of debris and water, or filled with pea gravel/sand? | <input checked="" type="checkbox"/> | _____ | _____ |
| e | Is the well locked and is the lock in good condition? | <input checked="" type="checkbox"/> | _____ | _____ |

3 Surface pad

- | | | | | |
|---|--|-------------------------------------|-------|-------|
| a | Is the well pad in good condition (not cracked or broken)? | <input checked="" type="checkbox"/> | _____ | _____ |
| b | Is the well pad sloped away from the protective casing? | <input checked="" type="checkbox"/> | _____ | _____ |
| c | Is the well pad in complete contact with the protective casing? | <input checked="" type="checkbox"/> | _____ | _____ |
| d | Is the well pad in complete contact with the ground surface and stable? (not undermined by erosion, animal burrows, and does not move when stepped on) | <input checked="" type="checkbox"/> | _____ | _____ |
| e | Is the pad surface clean (not covered with sediment or debris)? | <input checked="" type="checkbox"/> | _____ | _____ |

4 Internal casing

- | | | | | |
|---|---|-------------------------------------|-------|-------|
| a | Does the cap prevent entry of foreign material into the well? | <input checked="" type="checkbox"/> | _____ | _____ |
| b | Is the casing free of kinks or bends, or any obstructions from foreign objects (such as bailers)? | <input checked="" type="checkbox"/> | _____ | _____ |
| c | Is the well properly vented for equilibration of air pressure? | <input checked="" type="checkbox"/> | _____ | _____ |
| d | Is the survey point clearly marked on the inner casing? | <input checked="" type="checkbox"/> | _____ | _____ |
| e | Is the depth of the well consistent with the original well log? | <input checked="" type="checkbox"/> | _____ | _____ |
| f | Is the casing stable? (or does the pvc move easily when touched or can it be taken apart by hand due to lack of grout or use of slip couplings in construction) | <input checked="" type="checkbox"/> | _____ | _____ |

5 Sampling: Groundwater Wells Only:

- | | | | | |
|---|---|-------------------------------------|-------------------------------------|-------|
| a | Does well recharge adequately when purged? | <input checked="" type="checkbox"/> | _____ | _____ |
| b | If dedicated sampling equipment installed, is it in good condition and specified in the approved groundwater plan for the facility? | _____ | <input checked="" type="checkbox"/> | X |
| c | Does the well require redevelopment (low flow, turbid)? | _____ | <input checked="" type="checkbox"/> | _____ |

6 Based on your professional judgement, is the well construction / location appropriate to 1) achieve the objectives of the Groundwater Monitoring Program and 2) comply with the applicable regulatory requirements?

X _____

Glossary

Abbreviation

These commonly used abbreviations may or may not be present in this report.

□	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Roswell, GA 30076

ATTN: Evan Perry of Atlantic Coastal Consulting

SUBJECT: Plant McIntosh Landfill #4: 20 wells

The following data has been established on the existing wells using Georgia State Plane East Zone (NAD 83 horizontal and NAVD 88 vertical). Wells were surveyed to the following tolerances: 0.01' vertical and 0.5' horizontal via conventional survey methods, GPS, OPUS processing, and level loops. Each well was cross-checked for horizontal and vertical accuracy.

WELL ID	NORTHING	EASTING	ELEVATION	ELEVATION	ELEVATION

PROFESSIONAL ENGINEER CERTIFICATION

"I hereby certify that this Alternative Source Demonstration prepared for Georgia Power Company's Plant McIntosh Coal Combustion Residuals Existing Landfill No. 4 meets requirements in Georgia Administrative Code Rule 391-3-4-.14 and that the information used in this report is accurate pursuant to the requirements of Georgia Administrative Code Rule 391-3-4-.14 (23). I am a duly licensed Professional Engineer under the laws of the state of Georgia."

John M. Trast, P.E.
License No. PE41928

1. Introduction

This document presents an alternative source demonstration (ASD) for the statistically significant increase (SSI) of the state Appendix I groundwater monitoring parameter chromium detected in the sample collected from monitoring well GWC-19 during the September 2019 semiannual detection monitoring event at Georgia Power Company's (GPC's) Plant McIntosh (the Site) Coal Combustion Residuals (CCR) Existing Landfill No. 4 (Landfill No. 4). This ASD has been prepared pursuant to Georgia Environmental Protection Division Rules for Solid Waste Management 391-3-4-.14(23).

The SSI for chromium is a result of natural variability in groundwater or the result of sampling or analytical error and is not caused by a release from Landfill No. 4. Groundwater monitoring data and statistical analysis reports discussed herein were included in the *2019 Annual Groundwater Monitoring and Corrective Action Report* (GEI, 2020).

1.1 Site Location and Background

The Site is located at 981 Old Augusta Central Road, in southeast Effingham County, Georgia, approximately 4 miles northeast of the city of Rincon, and 20 miles north-northwest of the city of Savannah. The Site is situated on the west bank of the Savannah River at Big Kiffer Point (Figure 1). Landfill No. 4 is permitted to receive CCR generated from the plant and is on the western portion of the plant property, approximately 1.5 miles west of the Savannah River and approximately 800 feet south of Lockner Creek.

Landfill No. 4 is partially constructed with CCR placed in Cells 1 and 2A (Figure 2). Closure construction for Cell 1 began in June 2015 and final cover construction was completed in August 2016. GPC began construction of Cell 2A in June 2015 and received approval to begin receiving solid waste for disposal on July 20, 2017. Cell 2A began receiving CCR in September 2017. Cells 2B, 3, and 4 are reserved for future development.

Landfill No. 4 is currently in detection monitoring. The certified statistical methods for Landfill No. 4 specify the use of introwell prediction limits (PLs) for a state-modified list of Appendix I parameters, which compares concentrations detected in a well to a limit established using its own background data without using comparison data from surrounding upgradient wells. Statistical analysis of data from the September 2019 detection monitoring event identified a single chromium SSI in downgradient monitoring well GWC-19.

1.2 Geology and Hydrogeology

The Site is situated on sediments that were deposited from the Cretaceous to Pleistocene period and consist of stratified marine deposits and materials eroded from crystalline rock of the Piedmont Region. The lithology described in the boring logs at Landfill No. 4 as interbedded clays, silts, and sands typical of Coastal Plain sediments. The uppermost aquifer at Landfill No. 4 is the surficial aquifer, characterized by silty to sandy clays, clayey silts, silty sands, and fine to medium grained sands.

As documented in the *2019 Annual Groundwater Monitoring and Corrective Action Report* (GEI, 2020), the general direction of groundwater flow across Landfill No. 4 is toward the northwest, north-northeast, and northeast (Figure 3). The groundwater flow pattern observed during the September 2019 detection monitoring event is consistent with historical observations. The calculated groundwater flow velocity at Landfill No. 4 is approximately 19 feet per year. As shown on Figure 3, monitoring well GWC-19 is situated downgradient along the northwestern side of Cell 2 A at Landfill No. 4.

2. Alternative Source Demonstration

A chromium concentration of 0.0043 milligrams per liter (mg/L) was detected at downgradient well GWC-19 during the September 2019 sampling event indicating an SSI as a result of introwell statistical analysis (Table 1). Based on the review of Landfill No. 4 information and data analysis, the chromium SSI at well GWC-19 is due to the natural variability of chromium concentrations in background groundwater or sampling or analytical error and not the result of a release from the CCR unit. The following lines of evidence discussed below support this conclusion:

- The detection of chromium in GWC-19 represents a single-parameter SSI. A release from the CCR unit would result in multiple parameter SSIs. The absence of SSIs for other Appendix I and III parameters in well GWC-19 supports the conclusion that the chromium SSI in GWC-19 is not the result of a release from Landfill No. 4.
- Historically, concentrations of chromium in background monitoring wells, including wells GWA-13, GWC-17, and GWC-18, exhibit variability and are frequently higher when compared to chromium concentrations at GWC-19. This demonstrates that comparable chromium concentrations are observed in background groundwater monitoring wells.
- The chromium concentrations detected at Landfill No. 4 during the September 2019 monitoring event are very low, ranging from 0.0025 mg/L (GWC-9 and GWC-21) to 0.0072 mg/L (GWC-11).

The following sections present further details regarding the evidence supporting the conclusion that the chromium SSI is the result of natural variability in concentrations of naturally occurring chromium or a result of sampling or analytical error and is not caused by a release from Landfill No. 4.

2.1 Absence of Other SSIs

There are no other SSIs for Appendix I or III parameters identified in GWC-19 at Landfill No. 4. A release from Landfill No. 4 would result in SSIs of multiple state Appendix I and Appendix III parameters. The absence of multiple SSIs in well GWC-19 indicates the chromium SSI in GWC-19 is not the result of a release from Landfill No. 4. As shown on Table 1 and Figure 4, the September 2019 chromium result in GWC-19 is anomalous compared to historical results. Coupled with the absence of a similar increase in other

constituents, it is likely that this single-parameter increase is the result of sampling or analytical error.

2.2 Upgradient Chromium Monitoring Data

In 2019, monitoring wells GWA-13, GWC-17, and GWC-18, which are grouped in the background groundwater monitoring well pool, exhibited chromium concentrations higher than those detected in GWC-19 at 0.0052 mg/L, 0.0059 mg/L, and 0.0049 mg/L, respectively (Table 1). The presence of elevated concentrations of chromium in the background wells demonstrates that chromium is naturally occurring at Landfill No. 4. Since upgradient concentrations exceed those observed in downgradient wells, it is reasonable to conclude that downgradient detections reflect natural background groundwater quality.

The evaluation of natural groundwater variability in determining the validity of the ASD for chromium was assessed through the review of upgradient and downgradient chromium concentration data collected during monitoring events performed between 2004 and 2019. Chromium concentrations detected at Landfill No. 4 upgradient monitoring wells and GWC-19 are summarized as Box and Whiskers Plots shown on Figure 5. As shown on the plots, chromium concentrations range from 0.00072 mg/L (GWA-16(*GWB-16), June 2016) to 0.0096 mg/L (GWC-4A(*GWB-4A), July 2012). Among the 10 background wells, eight background wells have mean chromium concentrations higher than GWC-19 across their respective monitoring periods than GWC-19. The observed variability of background chromium concentrations supports the conclusion that the chromium SSI observed at well GWC-19 is the result of natural variation.

3. Conclusion

Based on information presented in this ASD, the SSI for chromium at GWC-19 is a result of natural variability in groundwater quality or sampling or analytical error and is not caused by a release from Landfill No. 4. Therefore, Landfill No. 4 will remain in detection monitoring in spring 2020 for the first semiannual monitoring event.

Plant McIntosh Existing Landfill No. 4

Effingham County, Georgia

General Notes:

-- - not sampled

CAS No. - Chemical Abstracts Service Registry Number

Bolded - detected value

µS/cm - microsiemens per centimeter

mg/L - milligrams per liter

mV - millivolts

NTU - nephelometric turbidity units

SU - Standard Units

*Change requested in the November 2018 permit submittal. Well designations will be updated once application is approved. Well IDs in parentheses are the proposed Well IDs.

Temperature, specific conductance, pH, dissolved oxygen (DO), oxidation-reduction potential (ORP), and turbidity were measured and recorded in the field.

Lab Qualifiers:

< - The analyte was not detected at a concentration above the specified laboratory reporting limit.

B - The analyte was detected in the associated method blank.

F1 - MS and/or MSD recovery is outside the acceptance limits.

J - The result is an estimated value.

1.0 Introduction

This alternate source demonstration (ASD) has been prepared pursuant to 40 CFR § 257.94(e)(2) and the EPD Rules for Solid Waste Management Chapter 391-3-4-.10(6)(a), which allow the owner/operator to demonstrate that a source other than the unit caused the statistically significant increase (SSI). This ASD demonstrates that the SSI identified by statistical analysis resulted from an error in statistical evaluation and natural variation in groundwater quality and is not the result of a release from the CCR unit.

An SSI for chloride was identified on June 17, 2020, following statistical analysis of data collected during the March 2020 semiannual monitoring event. The SSI was confirmed by a verification resample collected on June 30, 2020. SSIs reported for the semiannual period are presented in Table 1, SSI Data Summary.

Table 1. SSI Data Summary

Constituent	Date	Location	Concentration	Inter-Well Prediction Limit
Chloride	4/1/2020	GWC-9	9.7	9.4
Chloride	6/30/2020*	GWC-9	11	9.4

Notes:

1. Appendix III refers to 40 CFR 257.
2. Units are mg/L.
3. * indicates verification resample.

2.0 Background

Georgia Power Company's (GPC) Plant McIntosh is located at 981 Old Augusta Central Road, in Effingham County, Georgia, approximately 4 miles northeast of the City of Rincon, and 20 miles north of the City of Savannah. The plant is situated on approximately 2,300 acres west of the Savannah River. Plant McIntosh Existing Landfill No. 4 (Site) is located on the western portion of plant property.

Landfill No. 4 is composed of Cells 1, 2A, and 2B. Closure construction for Cell 1 of Landfill No. 4 began in June 2015 and final cover construction was completed in August 2016. GPC began construction of Cell 2A in June 2015 and received approval to begin receiving solid waste for disposal on July 20, 2017. Cell 2A of Landfill No. 4 began receiving CCR waste in September 2017. Cell 2B is for future development.

The facility is permitted to operate the Georgia Environmental Protection Division (EPD) [Permit No. 051-008D(LI)]. Figure 1, Site Location Map, depicts the location of Plant McIntosh and Existing Landfill #4 referenced to regional landmarks. A recent potentiometric surface map is provided for reference as Figure 2, March 2020 Potentiometric Surface Map.

3.0 Alternate Source Demonstration

Pursuant to 40 CFR § 257.94(e)(2) and EPD Rule 391.-3-4-.10(6)(a), the following provides a demonstration that the SSIs reported during the 2020 semi-annual detection monitoring event are not the result of a release from Landfill No. 4 and that assessment monitoring is not required. The lines of evidence supporting this conclusion are:

- The low-level chloride concentrations in well GWC-9 are stable over time with no discernable increasing trend;
- Other Appendix III CCR indicator parameters do not exhibit SSIs;
- Chloride was documented at higher than current levels at GWC-9 prior to the construction of Cell 2A in 2017. Additionally, the unit is HDPE lined with a leachate collection system designed and operated to eliminate the potential pathway from the unit to groundwater.

3.1 Stability of GWC-9 Chloride Concentrations

Chloride concentrations are low level with a statistically significant decreasing trend. Review of the sampling data show that March and June 2020 chloride concentrations in the well (9.7 and 11 milligrams per liter [mg/L], respectively) that only slightly exceed the inter-well prediction limit of 9.4 mg/L. A release from the unit would result in statistically significant increasing trends of chloride, which are not present in the data. Trend test results included in Appendix A are provided to illustrate that recent concentrations are slightly less than in background samples.

To further confirm statistical increases are not occurring for chloride at GWC-9, an intra-well prediction limit was calculated using Sanitas statistical software in accordance with the methodology included in the facility's statistical analysis plan. Based on the analysis a prediction limit of 16.4 mg/L was calculated for chloride at GWC-9, which is higher than any of the 19 chloride results obtained from this location to date.

An impact to groundwater from the CCR unit will result in increasing trends and concentrations significantly elevated above the statistical limit. As shown in Appendix A, such an increase has not occurred. In fact, the concentrations remain very low and show a decreasing trend.

2.2 Single Parameter SSI

Only chloride exhibits an SSI, other Appendix III indicator parameters are not detected at elevated concentrations. A release from Landfill No. 4 would cause SSIs of multiple Appendix III parameters such as boron, calcium, and sulfate. The absence of multiple SSIs and the absence of statistically significant increasing trends in chloride supports the conclusion that the chloride SSI at GWC-9 is not the result of a release from Landfill No. 4.

2.3 Lack of Migration Pathway

Hydrogeologic and unit operation factors make it unlikely for an impact to GWC-9 to have occurred. As shown in Figure 2, GWC-9 is approximately 150 feet east of Cell 2A and the

sediment pond clear pool. Cell 2A was constructed in 2016 and started receiving waste in September 2017. Chloride was detected in multiple GWC-9 samples at higher levels prior to waste placement than the March and June 2020 concentrations.

Cell 2A is constructed with a 60-mil high-density polyethylene (HDPE) liner system and leachate collection system that is designed and constructed to prevent infiltration of leachate to groundwater. The sediment pond captures storm water that has not been in contact with CCR and allows for settlement of suspended solids (i.e. soils). The storm water pond is underlain with a Geosynthetic Clay Liner (GCL) to prevent infiltration and direct storm water to the outfall. The outfall discharge is located at a topographic low approximately 175 feet south of GWC-9 and not hydraulically downgradient. A drawing depicting the Site layout that was included as Sheet 28 of 29 in the November 2018 Permit Application is provided in Appendix B.

3.0 Conclusion

Based on the information presented in this ASD, the chloride SSI presented in the 2020 Semiannual Groundwater Monitoring and Corrective Action Report is not attributed to a release from the CCR Landfill. The SSI is the result of natural variation in groundwater quality not fully accommodated by the statistical evaluation method. Therefore, in accordance with §257.94(e)(2) and EPD Rule 391.-3-4-.10(6)(a), Landfill No. 4 will remain in detection monitoring. Detection monitoring results will continue to be presented in annual and Semiannual Groundwater Monitoring and Corrective Action Reports.

Re: Plant McIntosh Landfill #4
April 2020 Statistical Analysis

Dear Ms. Jurinko,

Groundwater Stats Consulting, formerly the statistical consulting division of Sanitas Technologies, is pleased to provide the April 2020 Semi-Annual Groundwater Monitoring and Statistical summary of the analysis of groundwater quality for Georgia Power Company's McIntosh Landfill #4. The analysis complies with the federal rule for the Disposal of Coal Combustion Residuals from Electric Utilities (CCR Rule, 2015), the Georgia Environmental Protection Division Rules for Solid Waste Management Chapter 391-3-4-.10, and follows the United States Environmental Protection Agency (USEPA) Unified Guidance (2009).

Sampling began for the CCR program in 2016, and sampling for 16 parameters in accordance with the Georgia EPD's Solid Waste Permit began for some wells in 2006. At least 8 background samples have been collected at each of the groundwater monitoring wells. Semi-annual sampling for select constituents has been performed for several years in accordance with the Georgia Department of Natural Resources, Environmental Protection Division groundwater monitoring regulations; and all available data are screened in this report.

The monitoring well network, as provided by Southern Company Services, consists of the following:

- **Upgradient:** GWA-2, GWA-3, GWC-4A[*GWB-4A], GWC-5[*GWB-5], GWA-13, GWA-14, GWC-15[*GWB-15], GWA-16[*GWB-16], GWC-17, and GWC-18

- **Downgradient:** GWC-1, GWC-9, GWC-10, GWC-11, GWC-12, GWC-19, GWC-20, GWC-21, and GWC-23

Data were sent electronically to Groundwater Stats Consulting, and the statistical analysis was reviewed by Dr. Jim Loftis, Civil & Environmental Engineering professor emeritus at Colorado State University and Senior Advisor to Groundwater Stats Consulting. The analysis is prepared according to the recommended statistical methodology prepared in the Fall 2017 by Dr. Kirk Cameron, PhD Statistician with MacStat Consulting, primary author of the USEPA Unified Guidance.

The following constituents were evaluated:

- **CCR Appendix III** - boron, calcium, chloride, fluoride, pH, sulfate, and TDS
- **Georgia EPD** - antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, nickel, selenium, silver, thallium, vanadium, and zinc

Note that when there are no detections present in downgradient wells for a given constituent, statistical analyses are not required. Since mercury was not required by the previous permit, it was not included in the statistical analysis.

Due to varying detection limits in background data sets, generally due to improved laboratory practices, a substitution of the most recent reporting limit is used for all nondetects. Note that for calculation of intrawell prediction limits, substitution of the most recent reporting limit is performed separately for each well/parameter pair. In some cases, the reporting limit provided by the laboratory contained varying limits for a given parameter; therefore, the substitution may differ from well to well. This generally gives the most conservative limit in each case. However, in the time series plots, a single reporting limit substitution is used across all wells for a given parameter since the wells are plotted as a group.

Time series plots for Appendix III and Georgia EPD parameters at all wells are provided for the purpose of screening data at these wells (Figure A). Additionally, a separate section of box plots is included for all constituents at upgradient and downgradient wells (Figure B). The time series plots are used to initially screen for suspected outliers and trends, while the box plots provide visual representation of variation within individual wells and between all wells. Values in background which have been flagged as outliers may be seen in a lighter font and as a disconnected symbol on the graphs.

In earlier analyses, data at all wells for constituents detected in downgradient wells were evaluated for the following: 1) outliers; 2) trends; 3) most appropriate statistical method

based on site characteristics of groundwater data upgradient of the facility; and 4) eligibility of downgradient wells when introwell statistical methods are recommended. Power curves were provided in the previous screening to demonstrate that the selected statistical methods for the parameters listed above comply with the USEPA Unified Guidance and the Georgia Environmental Protection Division Rules for Solid Waste Management Chapter 391-3-4-.10. The EPA suggests the selected statistical method should provide at least 55% power at 3 standard deviations or at least 80% power at 4 standard deviations. Power curves were based on the following:

Georgia EPD Constituents:

- Semi-Annual Sampling
- Intrawell Prediction Limits with 1-of-3 resample plan (all Georgia EPD parameters)
- # Constituents: 15 (Mercury not included)
- # Downgradient wells: 9

CCR Appendix III Constituents:

- Semi-Annual Sampling
- Intrawell Prediction Limits with 1-of-2 resample plan – (sulfate)
- Interwell Prediction Limits with 1-of-2 resample plan – (boron, calcium, chloride, fluoride, pH, and TDS)
- # Constituents: 7
- # Downgradient wells: 9

Parametric prediction limits are utilized when the screened historical data follow a normal or transformed-normal distribution. When data cannot be normalized or the majority of data are nondetects, a nonparametric test is utilized. While the false positive rate associated with the parametric limits is based on an annual 10% (5% for each semi-annual sample event) as recommended by the EPA Unified Guidance (2009), the false positive rate associated with the nonparametric limits is dependent upon the available background sample size, number of future comparisons, and verification resample plan. The distribution of data is tested using the Shapiro-Wilk/Shapiro-Francia test for normality. After testing for normality and performing any adjustments as discussed below (US EPA, 2009), data are analyzed using either parametric or non-parametric prediction limits.

- No statistical analyses are required on wells and analytes containing 100% nondetects (USEPA Unified Guidance, 2009, Chapter 6).

- When data contain <15% nondetects in background, simple substitution of one-half the reporting limit is utilized in the statistical analysis. The reporting limit utilized for nondetects is the practical quantification limit (PQL) as reported by the laboratory.
- When data contain between 15-50% nondetects, the Kaplan-Meier nondetect adjustment is applied to the background data. This technique adjusts the mean and standard deviation of the historical concentrations to account for concentrations below the reporting limit.
- Nonparametric prediction limits are used on data containing greater than 50% nondetects.

Natural systems continuously evolve due to physical changes made to the environment. Examples include capping a landfill, paving areas near a well, or lining a drainage channel to prevent erosion. Periodic updating of background statistical limits is necessary to accommodate these types of changes. In the interwell case, prediction limits are updated with upgradient well data during each event after careful screening for any new outliers. In the intrawell case, data for all wells and constituents may re-evaluated when a minimum of 4 new data points are available to determine whether earlier concentrations are representative of present-day groundwater quality. In some cases, an earlier portion of data is deselected prior to construction of limits to provide sensitive limits that will rapidly detect changes in groundwater quality. Even though the data are excluded from the calculation, the values will continue to be reported and shown in tables and graphs.

Background Screening Summary – Georgia EPD – Conducted in August 2019

Outlier and Trend Testing

Time series plots are used to identify suspected outliers, or extreme values that would result in limits that are not representative of the current background data population. Suspected outliers at all wells and parameters are formally tested using Tukey's box plot method and, when identified, flagged in the computer database with "o" and deselected prior to construction of statistical limits.

Using the Tukey box plot method, several outliers were identified. When the most recent values are identified as outliers, values are not flagged in the database at that time (except in cases where they would cause background limits to be elevated) as they may represent a possible trend. If future values do not remain at similar concentrations, these values will be flagged as outliers and deselected. Several low values exist in the data sets and appear on the graphs as possible low outliers relative to the laboratory's Practical Quantitation Limit. However, these values are observed trace values (i.e. measurements reported by the

laboratory between the Method Detection Limit and the Practical Quantitation Limit) and, therefore, were not flagged as outliers. Due to changing reporting limits for many constituents, when the nondetects are replaced with the most recent reporting limit, previously flagged "J" values (or estimated values) may require flagging as outliers if they are much higher than current reporting limits. This was not required in this screening.

Of the outliers identified by Tukey's method, several values were flagged in the database, and the remaining values were similar to other measurements within a given well or neighboring wells or were reported nondetects. Several other values were flagged in addition to those identified by Tukey's because the values were higher than all remaining concentrations and would cause the statistical limits to be elevated. All flagged values were reviewed in the current (June 2020) analysis. An additional value of cobalt was flagged in well GWC-21. Values of several constituents were unflagged when they were only slightly higher than other detected values and appeared to represent natural variation. The resulting prediction limits will still be conservative, yet less prone to false positives. A summary of all flagged values is included in Figure C.

Additionally, when any values are flagged in the database as outliers, they are plotted in a disconnected and lighter symbol on the time series graph. The accompanying data pages display the flagged value in a lighter font as well. A substitution of the most recent reporting limit was applied when varying detection limits existed in data.

No obvious seasonal patterns were observed on the time series plots for any of the detected data; therefore, no deseasonalizing adjustments were made to the data. When seasonal patterns are observed, data may be deseasonalized so that the resulting limits will correctly account for the seasonality as a predictable pattern rather than random variation or a release.

While trends may be identified by visual inspection, a quantification of the trend and its significance is needed. The Sen's Slope/Mann Kendall trend test, which tests for statistically significant increasing or decreasing trends, was used to evaluate data at all upgradient wells and downgradient wells with detections.

In the absence of suspected contamination, significant trending data are typically not included as part of the background data used for construction of prediction limits. This step serves to eliminate the trend and, thus, reduce variation in background. When statistically significant decreasing trends are present, all available data are evaluated to determine whether earlier concentration levels are significantly different from current reported concentrations and will be deselected as necessary. A few statistically significant increasing trends were noted for barium in wells GWA-2, GWC-1, and GWC-5 (formerly

GWB-5) and adjustments were made to eliminate the trend. A summary report showing the date ranges used in construction of the statistical limits follows this report.

Determination of Spatial Variation

The Analysis of Variance (ANOVA) was used to statistically evaluate differences in average concentrations among upgradient wells for constituents detected in downgradient wells. The ANOVA assists in identifying the most appropriate statistical approach. Interwell tests, which compare downgradient well data to statistical limits constructed from pooled upgradient well data, are appropriate when average concentrations are similar across upgradient wells. Intrawell tests, which compare compliance data from a single well to screened historical data within the same well, are appropriate when upgradient wells exhibit spatial variation; when statistical limits constructed from upgradient wells are not representative of the current background data population; and when downgradient water quality is unimpacted compared to upgradient water quality for the same parameter.

The ANOVA identified significant differences among upgradient well data for: arsenic, barium, beryllium, cadmium, calcium, chromium, cobalt, copper, nickel, and thallium. No significant differences were noted for antimony, lead, selenium, vanadium, and zinc. The ANOVA could not test silver as there was no variation in the measurements among the upgradient wells.

Where variation is not identified, this suggests that interwell analysis would be the most appropriate statistical method for these constituents. However, because this is a lined landfill with pre-waste data showing that metals occur naturally in low level concentrations, and no records required any adjustments due to statistically significant increasing trends in data sets, intrawell methods are recommended as the primary statistical method for all detected well/constituent pairs.

Background Update Summary – Appendix III – Conducted in March 2020

Prior to updating background data, Tukey's outlier test and visual screening were used to evaluate data from all wells for intrawell parameters (sulfate) and upgradient wells for interwell parameters (boron, calcium, chloride, fluoride, pH, and TDS) through September 2019. Tukey's test noted potential outliers for all parameters except boron and fluoride, but not all of these values were flagged as most appeared to be representative of natural variation. Only values for sulfate in upgradient well GSC-18 and downgradient well GWC-23 were flagged. As mentioned above, any flagged data are displayed in a lighter font and as a disconnected symbol on the time series reports, as well as in a lighter font on the accompanying data pages.

For constituents requiring intrawell prediction limits (only sulfate in this instance), the Mann-Whitney (Wilcoxon Rank Sum) test was used to compare the medians of historical data through April 2017 to the new compliance samples at each well through September 2019. If the medians of the two groups are not significantly different at the 99% confidence level, background data are typically updated to include the newer compliance data. Statistically significant differences were found between the two groups for the following well/constituent pairs: sulfate in downgradient wells GWC-19, GWC-20, GWC-21, and GWC-23.

Typically, when the test concludes that the medians of the two groups are significantly different, particularly in the downgradient wells, the background data are not updated to include the newer data unless it can be reasonably justified that the change in concentrations reflects a naturally occurring shift unrelated to practices at the site. In studies such as the current one, in which at least one of the segments being compared is of short duration, the comparison is complicated by the fact that normal short-term variation may be mistaken for long-term change in medians. In this analysis, the more recent sulfate concentrations in all four cases with statistically significant Mann-Whitney results tended toward more stable concentrations at slightly lower levels than before. Therefore, all four cases were updated.

Statistical Analysis of Georgia EPD Constituents – April 2020

Intrawell limits constructed from carefully screened background data from within each well serve to provide statistical limits that are representative of the background data population, and that will rapidly identify a change in more recent compliance data from within a given well. The most recent sample from the same well is compared to its respective background. This statistical method removes the element of variation from across wells and eliminates the chance of mistaking natural spatial variation for a release from the facility.

In cases where downgradient average concentrations are higher than observed upgradient concentrations for a given constituent where intrawell analyses are recommended, the current assumption is that this is due to natural spatial variation rather than a result of practices at the landfill. Validation of this assumption requires a separate analysis or investigation that is beyond the scope of this data screening study. However, for this site, the pre-waste data support the assumption of natural variation rather than impacts of the landfill.

Intrawell prediction limits, combined with a 1-of-3 resample plan, were constructed using all available data, except for the cases mentioned above, within each well with detections

through July 2018 (Figure D). Compliance data are compared to these introwell background limits during each subsequent semi-annual sampling event. As mentioned above, no statistical analyses were included for well/constituent pairs with 100% nondetects.

In the event of an initial exceedance of compliance well data, the 1-of-3 resample plan allows for collection of two additional samples to determine whether the initial exceedance is confirmed. When the resamples confirm the initial exceedance, a statistically significant increase (SSI) is identified, and further research would be required to identify the cause of the exceedance (i.e. impact from the site, natural variation, or an off-site source). If any resample falls within the statistical limit, the initial exceedance is considered to be a false positive result, and no further action is necessary. A summary of prediction limits follows this report (Figure D). Statistical exceedances were noted for the following well/constituent pairs, all in upgradient wells:

- Barium: GWA-2 (upgradient)
- Chromium: GWA-16[*GWB-16] (upgradient)
- Copper: GWC-4A[*GWB-4A] (upgradient)

When prediction limit exceedances occur in any of the downgradient wells, data are further evaluated using the Sen's Slope/Mann Kendall trend test to determine whether concentrations are statistically increasing, decreasing, or stable. Upgradient wells are included in the trend analyses to identify whether similar patterns exist upgradient of the site which is an indication of natural variability in groundwater unrelated to practices at the site. In the current analysis all of the exceedances occurred in upgradient wells; therefore, no trend tests were needed.

Statistical Analysis of Appendix III Parameters – April 2020

For sulfate, introwell prediction limits, combined with a 1-of-2 resample plan, were constructed using all historical data through September 2019 (Figure E). As mentioned above, introwell limits constructed from carefully screened background data from within each well serve to provide statistical limits that are representative of the background data population, and that will rapidly identify a change in more recent compliance data from within a given well. Compliance data are compared to these introwell background limits during each subsequent semi-annual sampling event.

For boron, calcium, chloride, fluoride, pH, and TDS, interwell prediction limits, combined with a 1-of-2 resample plan, were constructed using all historical upgradient well data through April 2020 (Figure F). Interwell prediction limits pool upgradient well data to

establish a background limit for an individual constituent. The most recent sample from each downgradient well is compared to the background limit to determine whether there are statistically significant increases (SSIs). Note that for TDS, a nonparametric prediction limit was used in lieu of a parametric limit due to the variation among upgradient wells and in an effort to reduce the number of false positive results.

In the event of an initial exceedance of compliance well data, the 1-of-2 resample plan allows for collection of one additional sample to determine whether the initial exceedance is confirmed. If the resample falls within the statistical limit, the initial exceedance is considered to be a false positive result; therefore, no exceedance is noted, and no further action is necessary. If no resample is collected, the original result is considered a confirmed exceedance. Summary tables of the Appendix III prediction limits follow this letter (Figures E and F). The following prediction limit exceedances were noted for Appendix III parameters:

Intrawell:

- Sulfate: GWA-13 (upgradient)

Interwell:

- Chloride: GWC-9

Data from downgradient well/constituent pairs found to exceed their respective prediction limit were further evaluated using the Sen's Slope/Mann Kendall trend test along with upgradient wells for the same constituents (Figure G). Upgradient wells are included in the trend analyses for all parameters found to exceed their prediction limit in downgradient wells to identify whether similar patterns exist upgradient of the site. Such patterns are an indication of natural variability in groundwater unrelated to practices at the site. A summary of the trend test results follows this letter (Figure G). No statistically significant increasing trends were identified, but statistically significant decreasing trends were identified for the following well/constituent pairs:

- Chloride: GWA-3 (upgradient), GWC-9

Thank you for the opportunity to assist you in the statistical analysis of groundwater quality for Plant McIntosh's Landfill #4. If you have any questions or comments, please feel free to contact us.

Sanitas™ v.9.6.25 Groundwater Stats Consulting, UG
Hollow symbols indicate censored values.

Within Limit

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 31 background values. 87.1% NDs. Well-constituent pair annual alpha = 0.0003403. Individual comparison alpha = 0.0001701 (1 of 3).

Sanitas™ v.9.6.25 Groundwater Stats Consulting, UG
Hollow symbols indicate censored values.

Within Limit

Background Data Summary (after Kaplan-Meier Adjustment): Mean=0.003017, Std. Dev.=0.0006491, n=10, 40% NDs. Normality test: Shapiro Wilk @alpha = 0.01, calculated = 0.8435, critical = 0.781. Kappa = 2.224 (c=15, w=9, 1 of 3, event alpha = 0.05132). Report alpha = 0.0003901.

Sanitas™ v.9.6.26 Groundwater Stats Consulting, UG
Hollow symbols indicate censored values.

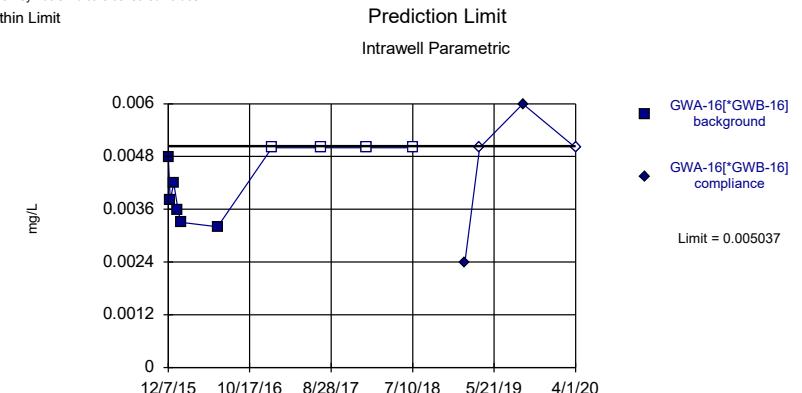

Within Limit

NP test selected by user. Limit is highest of 150 background values. 90.67% NDs. Annual per-constituent alpha = 0.001582. Individual comparison alpha = 0.00008795 (1 of 2). Comparing 9 points to limit.

Sanitas™ v.9.6.26 Groundwater Stats Consulting, UG

Within Limit

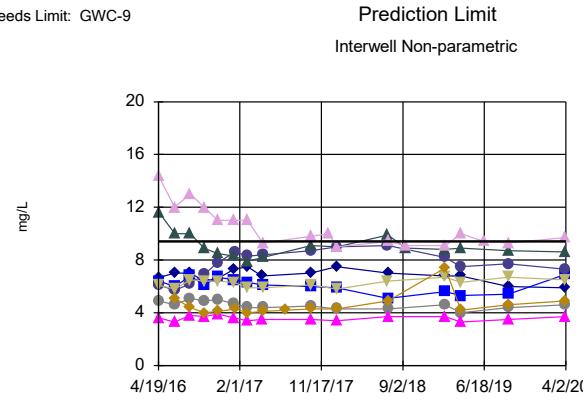

NP test selected by user. Limit is highest of 151 background values. Annual per-constituent alpha = 0.001561. Individual comparison alpha = 0.0000868 (1 of 2). Comparing 9 points to limit.

Constituent: Boron Analysis Run 6/17/2020 12:48 PM View: Appendix III - Interwell
